IMPORTANT PRE-ASSEMBLY INSTRUCTIONS
REQURED TOOLS

Depending on the model, it may not be necessary to carry out all assembly steps outlined in the manual. Therefore, please skip the respective steps if a component does not exist on your bike.

Follow this link to watch our bike assembly video:

In case you are unsure about any of the assembly steps just call us or alternatively ask your local bike shop for support.
Please note we assume no liability for incorrect bike assembly.

- Allen key 3 mm
- Allen key 4 mm
- Allen key 5 mm

Allen key 6 mm

- Allen key 8 mm
- Torx 25
- Pliers

Torque wrench

## 1 YOUR BIKE HAS ARRIVED

This is it! Your bike has arrived. Please carefully read the assembly instructions as well as the operator manual before unpacking and building your bike. If there is anything you are unsure of, please contact the Propain Service Team right away!

## 4 / REMOVE REAR END INSERT

Carefully remove the cardboard insert fixing rear end during transport. Please pay extra attention to the Mudfender, as this has not been completely tightened yet

## 10 / THE BIKE BOX IS A KEEPER!

Make sure you keep the bike box and all related cardboard inserts as well as other protective packaging material. They are essential in case you as other protective packaging material. They are essential in case you want to send your bike in for a service or warranty claim they will also protect your bike when going on holidays.

## 12 / INSTALL THE HANDLEBAR

Insert the handlebar into the stem and mount the clamp. Start with one of the top screws and tighten all screws crosswise, carefully following of the top screws and tighten all screws crosswise, carefully following he torque specification of the manufacturer. You can find this informa We tare no Pease $t$ ap), while the lower gap should be even

13 / TIGHTEN-UP THE MUDFENDER

Please use a 3 mm Allen Key to tighten up the Mudfender. In order to avo id damaging the part, please take care not to over-tighten the screws.

15 / UNPACK THE REAR DERAILLEUR

Carefully remove the zip ties with some pliers to unpack the rear derail eur. Take extra care not to damage the rear derailleur with the pliers!

## 14 / INSTALL THE SEAT

The seat should be attached to the seat post with a Torx 25 for Bike Yoke and a 4 mm Allen Key for Kind Shock and Fox seat posts. Loosen the upper plate and align the seat between both plates. Now tighten both the upper plate and align the seat between both plates. Now tighten both the manufacturer. You can find this information either in the enclosed manufacturer manual or directly on seat.

## 17/ OPEN THE TOP CAP ON THE FORK

Please remove the air topcap on the left side of the fork, in order to adjust the air pressure.

## 18 / FORK SET-UP

Please adjust the air pressure of your fork by using a shock pump until the full range of travel is reached. Now you can start to fine-tune your for se ur you achieve ad between $25-30 \%$. Once finished la 1 your bike.

## 19 / REMOVE PROTECTIVE COVERS

Now you can remove all remaining protective covers on wheels, seat and hain stay as well as on the fork

## 20 / REMOVE BRAKE SPACERS

Pease remove the spacers of the front and rear brake calliper. Please make sure you keep them for future bike transports.

21 / FRONT WHEEL ASSEMBLY
Insert the front wheel into the fork dropouts. Make sure the break disc is centered in the calliper to avoid damage. Insert the quick release axle and tighten-up. Do not over tighten the quick release and do not use any tools to increase leverage, close it firmly by hand. There should be no play in the front wheel.

## 22 / REAR WHEEL ASSEMBLY

Open the rear derailleur cage and activate the CAGE LOCK by pressing the small button with the lock symbol on it. Place the rear wheel in the frame and ensure the chain is on the smallest cog of the cassette. Fully insert the axle and tighten it firmly by hand with around $10-16 \mathrm{Nm}$. Release the CAGE LOCK again.

23 / YOUR BIKE IS READY

Before you head out on your first ride, please carry out the safety check explained in step 24!

## 24 / SAFETY FIRST - INITIAL BIKE CHECK

Check the shifters by shifting smoothly through all gears and without applying too much pressure on your pedals. Most likely the derailleur will need adjusting after the first few rides, as the gear cables tend to lengthe or will eventually become stiff and firm when pulled If there is. $n$ in mil erenculy bill braking performance increeases after a short break-in period. Therefore, ry to get used to the braking response in a safe environment. For furthe ry to get used to the braking response in a safe environment. For further information please refer to the enclosed manufacturer manual. Check

PROPAIN - THE RIDE OF YOUR LIFE
Congratulutions! You are about to go for the ride of your life. We know you are anxiou but before you hit the trails make sure you read and understand this manual, the safel information and make sure you set up your bike correctly.

To assemble your bicycle please read and follow the assembly instructions provided with your bike to assemble your bike correctly.

## This manual contains general safety, performance and service information applicable

 to all PROPAIN bicycles.To al PROPAN biccles.
The front and back cover of this manual contain specific safety, performance and service information applicable your PROPAIN bicycles model.Please pay special attention to all the information provided, and especially the safety information and cautions located throughout this owner's manual as they are in place to help you avoid serious injury.

If you encounter any issues with your bicycle that aren't covered in this manual, please If con encounter any issles with your bitycle that arent covered in this manual, please kes.com and chose your preferred option to contact us or one of our service partners.

We are proud that you chose a PRoPAIN bike to be your trusted partner on your future bike adventures. Now go and have the ride of your life!

Adult Manuul: 1Ith Edition, 2015
Juvenile Manual: 4th Edition, 2017

## IMPORTANT

This manual contains important safety, performance and service information. Read before you take the first ride on your new PROPAIN bicycle and keep it for reference.

Additional safety, performance and service information for specific components such as suspension or pedals on your bicycle, or for accessories such as helmets or lights tha you purchase, may also be available. Make sure that PROPAIN or your dealer has given you all the manufacturers' literature that was included with your bicycle or accessories, In case of a conffict between the instructions in this manual and information provided by a component manufacturer, always follow the component manufacturer's instructions. If you have any questions or do not understand something, take responsibility for your safety and consult with your dealer or PROPAIN bicycles (www.propain-bikes.com)

NOTE: This manual is not intended as a comprehensive use, service, repair or main tenance manual. Please see your bicycle dealer or contact PROPAIN for all service repairs or maintenance, Your dealer may also be able to refer you to classes, clinic or books on bicycle use, service, repair or maintenance.

## GENERAL WARNING:

Like any sport, bicycling involves risk of injury and damage. By choosing to ride a bicycle, ou assume the responsibility for that risk, so you need to know - and to practice - the miles of safe and responsible riuing and of proper use and maintenance. Proper use and maintenance of your bicycle reduces risk of injury.

This Manual contains many "Warnings" and "Cautions" concerning the consequences of failure to maintain or inspect your bicycle and of failure to follow safe cycling practices.

- The combination of the safety alert symbol $\pm$ and the word WARNING indicates a potentially hazardous situation which, if not avoided, could result in serious injury or death
- The combination of the safety alert symbol $\boxed{\text { and the word CAUTION }}$ indicates a potentially hazardous situation which, if not avoided, may result in minor or moderate injury, or is an alert against unsafe practices.
- The word CAUTION used without the safety alert symbol indicates a situation which, if not avoided, could result in serious damage to the bicycle or the voiding of your warranty.

Many of the Warnings and Cautions say "you may lose control and fall". Because any fall can result in serious injury or even death, we do not always repeat the warning of possible injury or death.

Because it is impossible to anticipate every situation or condition which can occur while idding, this Manual makes no representation about the safe use of the bicycle under all conditions. There are risks associated with the use of any bicycle which cannot be predicted or avoided, and which are the sole responsibility of the rider.

## A SPECIAL NOTE FOR PARENTS:

§ WARNNG: This manual covers both Adult and Juvenile, BYX and other types of youth-sized bicycles. And your child may be sold or may ride an adult-sized bicycle as well.

As a parent or guardian you are responsible for the activities and safety of your minor child, and that includes making sure that the bicycle is propery fitted to the child; that it is in good repair and safe operating condition; that you and your child have learned and understand the safe operation of the bicycle; and that you and your child have learred, understand and obey not only the applicable local motor vehicle, bicycle and traffic laws, but also the common sense rules of saffe and responsible bicycling. As a parent y you should read this manual, as wel as review its warnings and the bicyclés functions and operating procedures with your child, before letting your child ride the bicycle.
! WARNNG: Make sure that your child always wears an approved bicycle helWaRNNG: Make sure that your child always wears an approved bicycle hel-
met when riding; but also, make sure that your child understands that a bicycle helmet is for bicycling only, and must be removed when not riding. A helmet must not . a i . tils he Youreol feed need to touch the ground when your kid is sitting on the saddle.
6. Do you fully understand how to operate your new bicycle? I not, before your fir ride, have PROPAIN explain any functions or features which you do not understand.

## B. SAFETY FIRS

1. Always wear an approved helmet when riding your bike, and follow the helmet manufacturer's instructions for fit, use and care
2. Do you have all the other required and recommended safety equipment? See Sec tion 2 . It's your responsibility to familiarize yourself with the laws of the areas where you ride, and to comply with all applicable laws.
3. Do you know how to correctly secure your front and rear wheels? Check Section 4.A. 1 to make sure. Riding with an improperly secured wheel can cause the wheel wobble or disengage from the bicycle, and cause serious injury or death.
4. If your bike has toe clips and straps or clipless ("step-in") pedals, make sure you
 skills Follow the pedal manufacturer's instruction for use adjustment and care.
5. Do you have "toe overlap"? On smaller framed bicycles your toe or toe clip may be ale contact the front wheel when a pedal is all the way forward and the wheel is able to contact Seer font wheel when a pedalis sal the way forward an
6. Can you comfortably operate the brakes? If not, you may be able to adjust thei angle and reach. See Section 3.D and 3.E.
7. Does your bike have suspension? If so, check Section 4.F. Suspension can change the way a bicycle performs. Follow the suspension manufacturer's instructions for use, adjustment and care.

## c. MeChanical safety check

Routinely check the condition of your bicycle before every ride.
Nuts, bolts screws \& other fasteners: Because manufacturers use a wid variety of fastener sizes and shapes made in a variety of materials, often differing by model and component, the correct tightening force or torque cannot be generalized. To make sure that the many fasteners on your bicycle are correctly tightened, refer to the Fastener Torque Specifications in Appendix E of this ma nual or to the torque specifications in the instructions provided by the manufaaturer of the component in question. Correctly tightening a fastener requires a calibrated torque wrench. A professional bicycle mechanic with a torque wrench should torque the fasteners on you bicycle. If you choose to work on your on bicycle, you must use a torque wrench and the correct tightening torque speciadiustment at home or in the field we wroe you to exercise care and to have the fasteners you worked on checked by a bicycle dealer as son as possibe Not that there wried on checked by a bicyle dealer as soon as possile In Sections 3 and 4 we discuss the items which you may be able to adjust yoursel. All other adjustments and repairs should be done by a qualified bicycle mechanic.
. WARNIN: Correct tightening force on fasteners -nuts, bolts, screws-on your bicycle is important. Too iitte force, and the fastener may not hold securely. To much force, and the fastener can striip threads, stretch, deform or break. Either wa incorrect tightening force can result in component failure, which can cause you io lose control and fall.

Make sure nothing is loose. Lift the front wheel off the ground by two or three inches, then let it bounce on the ground. Anything sound, feel or look loose? Do a visual and tactile inspection of the whole bike. Any loose parts or accessories? If so secure them. If youre not sure, ask someone with experience to check.

- Tires \& Wheels: Make sure tires are correctly inflated (see Section 4.6.1). Chec by putting one hand on the saddle, one on the intersection of the handlebars and tem, then bouncing your weight on the bike while looking at tire deflection. Compa e what you see with how it looks when you know the tires are correctly inflated; an ajust if necessary.
Tires in good shape? Spin each wheel slowly and look for cuts in the tread and - dewall Replace damaged tires before riding the bike.

Wheels true? Spin each wheel and check for brake clearance and side-to-sid - If a whed wobles side to side even slightly or rubs against or hits sis rake pads take the bike to a qualified bike shop to have the wheel trued.
. caution: Wheels must be true for rim brakes to work effectively. Wheel trueing is a skill which requires special tools and experience. Do not attempt to true wheel unless you have the knowledge, experience and tools needed to do the job correctly.

Wheel rims clean and undamaged? Make sure the rims are clean and undamaged the tire bead and, if you have rim brakes, along the braking surface. Check to make sure that any rim wear indicator marking is not visible at any point on the wheel rim .
\$ WARNING: Bicycle wheel rims are subject to wear. Ask your PROPAIN about wheel $r$ rim wear. Some wheel $r$ rims have a rim wear indicator which becomes visible as the rim's braking surface wears. A visible rim wear indicator on the side of the wheel rim is an indication that the wheel rim has reached its maximum usable life. Riding a wheel that is at the end of its usable life can result in wheel failure, which an cause you to lose control and fall.

- Brakes: Check the brakes for proper operation (see Section 4.C). Squeeze the brake levers. Are the brake quick-releases closed? All control cables seated and securely engaged? If you have rim brakes, do the brake pads contact the wheel rim squarely and make full contact with the rim? Jo the brakes begin to engage within an .in tel 10 dith having them touch the handlebar? If not, your brakes need adjustment. Do not ride
 Whee r retention ss

Seat post: If your seat post has an over-center cam action fastener for easy height adjustment, check that it is properly adjusted and in the locked position. See Section 4.B.

- Handlebar and saddle alignment: Make sure the saddle and handlebar stem are paralie to the bikes center line and clamped tight enough so that you can't twist them out of a lignment. See Sections 3.B and 3.C.
- Handlebar ends: Make sure the handlebar grips are secure and in good condtion, with no cuts, tears, or worn out areas. If not, have a bicycle dealer replace them. Make sure the handlebar ends and extensions are plugged. If not, have PROPAIN or a bicycle dealer plug them before you ride. If the handlebars have bar end extensions, make sure they are clamped tight enough so you can't twist them.
WARNNG: Loose or damaged handlebar grips or extensions can cause your . WARNino: Loose or dagaged handebar grips or extersions can cause you ol lose control and fall. Unplugged handlebars or extensions can cut you and cause serious injury in an otherwise minor accident.

## IERY IMPORTANT SAFETY NOTE. Please also read and become thoroughy famile

 Th the inporat inf in Appendix C.
## D. FIRST RIDE

When you buckle on your helmet and go for your first familiarization ride on your new cycle, be sure to pick a controleded environment, away from cars, other cyclists, obstacles or other hazards. Ride to become familiar with the controls, features and performances of your new bike. Familiarize yourseff with the braking action of the bike (see Sectio 4.C). Test the brakes at slow speed, putting your weight toward the rear and gently apply ing the brakes, rear brake first. Sudden or excessive application of the front brake could pitch you over the handlebars. Applying brakes too hard can lock up a wheel, which could cause you to lose control and fall. Skidding is an example of what can happen when a wheel locks up. If your bicycle has toe clips or clipless pedals, practice getting in and ou wheellocks up.I. Yyour bicycle has toe clips or Clipless sedals, practice getting in and out
of the pedals. See paragraph B.4 above and Section 4.E.4. fy your bike has suspension, familiarize yourself with how the suspension responds to brake application and rider weight shifts. See paragraph B.6 above and Section 4.F. Practice shifting the gears (see ection 4.0 ). Remember to never move the shifter while pedaling backward, nor ped backwards immediately after having moved the shifter. This could jam the chain and cause serious damage to the bicycle. Check out the handling and response of the bike; and not as it
2. SAFETY

## A. THE BASICS

\$ WARNNG: The area in which you ride may require specific safety devices. It is your responsibility to familiarize yourself with the laws of the area where you rid and to comply with all applicable laws, including properly equipping yourself and your bike as the law requires. Observe all local bicycle laws and regulations. Observe regulations about bicycle lighting, licensing of bicycles, riding on sidewalks, law regulating bike path and trail use, helmet laws, child carrier laws, special bicycle traffic laws. It's your responsibility to know and obey the laws.

1. Always wear a cycling helmet which meets the latest certification standards and is appropriate for the type of riding you do. Always follow the helmet manufacturer's instructions for fit, use and care of your helmet. Most serious bicycle injuries invol een avoided if the rider had
worn an appropriate helmet.

## A. WARNING: Failure to wear a helmet when riding may result in serious injury or death.

2. Always do the Mechanical Safety Check (Section 1.C) before you get on a bike.
3. Be thoroughly familiar with the controls of your bicycle: brakes (Section 4.C.) pedals (Section 4.E.); shitting (Section 4.0.)
4. Be careful to keep body parts and other objects away from the sharp teeth of chaiinrings, the moving chain, the turning pedals and cranks, and the spinning wheels of your bicycle.
5. Always wear:
a. Shoes that will stay on your feet and will grip the pedals. Make sure that shoe laces cannot get into moving parts, and never ride barefoot or in sandals,
b. Bright, visible clothing that is not so loose that it can be tangled in the bicycle or snagged by objects at the side of the road or trail.
c. Protective eyewear, to protect against airborne dirt, dust and bugs - tinted when the sun is bright, clear when it's not.
6. Unless your bicycle was specifically designed for jumping (See Appendix B, Intenled Use) don't jump with your bike. Jumping a bike, particularly a BMX or mountal e, can be fun; but it can put huge and unpredictable stress on the bicycle and it hycles as well rec with your hike read and understand Section 2 F
7. Ride at a speed appropriate for conditions. Higher speed means higher risk.

## B. RIDING SAFETY

1. Obey all Rules of the Road and all local traffic laws.
2. You are sharing the road or the path with others - motorists, pedestrians and other cyclists. Respect their rights.
3. Ride defensively. Always assume that others do not see you.
4. Look ahead, and be ready to avoid:
a. Vehicles slowing or turning, entering the road or your lane ahead of you, or coming up behind you.
b. Parked car doors opening.
c. Pedestrians stepping out.
d. Children or pets playing near the road.
e. Pot holes, sewer grating, railroad tracks, expansion joints, road or sidewalk onstruction, debris and other obstructions that could cause you to swerve into traffic, catch your wheel or cause you to have an accident.
f. The many other hazards and distractions which can occur on a bicycle ride.
5. Ride in designated bike lanes, on designated bike paths or as close to the edge of the road as possible, in the direction of traffic flow or as directed by local governing laws.
6. Stop at stop signs and traffic lights; slow down and look both ways at street inter sections. Remember that a bicycle always loses in a collision with a motor vehicle, so be prepared to yield even if you have the right of way.
7. Use approved hand signals for turning and stopping,
8. Never ride with headphones. They mask traffic sounds and emergency vehicle sirens, distract you from concentrating on what's going on around you, and their wire can tangle in the moving parts of the bicycle, causing you to lose control.
9. Never carry a passenger; and, before installing a child carrier or trailer, check with PROPAIN to make sure the bicycle is designed for it. If the bicycle is suitable for aidd carier or trailer, make sure that the carrier or trailer is correctly mounted, and the child is secured and wearing an approved helmet.
10. Never carry anything which obstructs your vision or your complete control of the 10.Never carry anylining which obstructs your vision or your complete contra

11 Never hitch a ride by holding on to another vehicle
12. Don't do stunts, wheelies or jumps. If you intend to do stunts, wheelies, jumps or go racing with your bike despite our advice not to, read Section 2.F, Downhill, Stunt
or Competition Biking, now. Think carefully about your skills before deciding to take the large risks that go with this kind of riding.
3. Don't weave through traffic or make any moves that may surprise people with whom you are sharing the road.
14. Observe and yield the right of way
15. Never ride your bicycle while under the influence of alcohol or drugs
16. If possible, avoid riding in bad weather, when visibility is obscured, at dawn, dus, or in the dark, or when extremely tired. Each of these conditions increases the risk of accident.

## C. OFF ROAD SAFETY

Werd an adult.

1. The variable conditions and hazards of off-road riding require close attention and specific skills. Starts slowly on easier terrain and build up your skills. If your bike has suspension, the increased speed you may develop also increases your risk of sing control and falling Get to know how to handle your bike safely before trying increased speed or more difficult terrain.
2. Wear safety gear appropriate to the kind of riding you plan to do
3. Don't ride alone in remote areas. Even when riding with others, make sure that someone knows where yourre going and when you expect to be back.
4. Always take along some kind of identification, so that people know who you are in case of an accident; and take along some cash for food, a cool drink or an emergency phone call.
5. Yield right of way to pedestrians and animals. Ride in a way that does not frighten or endanger them and give them enough room so that their unexpected moves don't endanger you.
6. Be prepared. If something goes wrong while youre riding off-road, help may not be close.
7. Before you attempt to jump, do stunt riding or race with your bike, read an understand Section 2.F.

## off Road respect

Obey the local laws regulating where and how you can ride off-road, and respect private roperty. You may be sharing the trail with others - hikers, equestrians, other cyclists. Respect their rights. Stay on the designated trail. Don't contribute to erosion by riding in
 re limpac them: and always take out everything you brought in.

## D. WET WEATHER RIDING

WARNING: Wet weather impairs traction, braking and visibility, both for the bicyclist and for other venicles sharing the road. The risk of an accident is dramatically increased in wet conditions.

Under wet conditions, the stopping power of your brakes (as well as the brakes of other vehicles sharing the road) is dramatically reduced and your tires don't grip nearly as well. This makes it harder to control speed and easier to lose contro. To make sure that you can slow down and stop safely in wet conditions, ride more slowly and apply your rakes earlier and more gradually than you would under normal, dry conditions. See also Section $4 . C$.

## E. NIGHT RIDING

Riding a bicycle a t night is much more dangerous than riding during the day. A bicyclist Riding a bicycle at night is much more dangerous than riding during the day. A bicyclist
is very difficult for motorists and pedestrians to see. Therefore, chidren should never ide at dawn, at dusk or at tight. Adults who choose to accept the greatly increased risk friding at dawn at dusk or at night need to take extra care both riding and choosing secialized equipment which helps reduce that risk. Consult PROPAIN about night riding safety equipment.

## A WARNNG: Reflectors are not a substitute for required lights. Riding at dawn

 at dusk, at night or at other times of poor visibility without an adequate bicycle lighting system and without reflectors is dangerous and may result in serious iniury or death.Bicycle reflectors are designed to pick up and reflect car lights and street lights in a wa that may help you to be seen and recoognized as a moving bicyclist.
A. CAUTION: Check reflectors and their mounting brackets regularly to make sure that they are clean, straight, unbroken and securely mounted. Have a bicycle are rlace damaged reflectors and straignten or tighten any hat are bent loose.

The mounting brackets of front and rear reflectors are often designed as brake straddle cable safety catches which prevent the straddle cable from catching on the tire tread if the cable jumps out of its yoke or breaks.
. WARNING: Do not remove the front or rear reflectors or reflector brackets from your bicycle. They are an integral part of the bicycle's safety system. Removing the reflectors reduces your visibility to others using the roadway. Being struck by other vehicles may result tin serious injury or death. The reflector brackets may pro tect you from a brake straddle cable catching on the tire in the event of brake cable Iddenly causing you to lose control and fall.

If you choose to ride under conditions of poor visibility, check and be sure you comply It all local laws about night riding, and take the following strongly recommended at ditional precautions:

- Purchase and install battery or generator powered head and tail lights which meet all requatary requirements for where you live and provide adequate visibility.

Wear light colored, reflective clothing and accessories, such as a reflective ves, reflective arm and leg bands, reflective stripes on your helmet, flashing lights attched to your body and/or your bicycle. Any reflective device o o light source that moves will help you get the attention of approaching motorists, pedestrians and other traffic.

Nake sure your cloking or anyling you may be carrying on the bicycle does no obstruct a reflector or light.

Make sure that your bicycle is equipped with correctly positioned and securely mounted reflectors.
While riding at dawn, at dusk or a t nigh Ride slowly.
Avoid dark areas and areas of heayy of fost-moving traftic.
Avoid road hazards.
It possible, ride on familiar routes

## If riding in traffic:

Be predictable. Ride so that drivers can see you and predict your movements.
Be alert. Ride defensively and expect the unexpected.

- If you plan to ride in traffic often, ask PROPAIN about traffic safety classes or good book on bicycle traffic safety.
F. EXTREME, STUNT OR COMPETITION RIDING

Whether you call it, Aggro, Hucking, Freeride, North Shore, Dowhhill, Jumping, Stunt Riding, Racing or something else: : if you engage in this sort of extreme, aggressive riding you will get hurt, and you voluntarily assume a greaty increased risk of injury or death. Not all bicycles are designed for these types of riding, and those that are may not be suitale for all types of aggressive riding. Check with PROPAIN about the suitability of your bicycle before engaging in extreme riding. When riding fast down hill, you can reach speeds achieved by motorcycles, and therefore face similar hazards and risks. Have pour bicycle and equipment carefully inspected by a qualified mechanic and be sure it is in perfect condition. Consult with expert riders, area site e personnel and race officials on conditions and equipment advisable at the site where you plan to ride. Wear appropriate safety gear, including an approved full face helmet, full finger gloves, and body armor. Ultimately, it is your responsibility to have proper equipment and to be familiar with course conditions.
. WARNING: Although many catalogs, advertisements and articles about bicycling depict riders engaged in extreme riding, this activity is extremely dangerous, increases your risk of injury or death, and increases the severity of any injury. Remember that he action depicted is being performed by professionals with many rind and her appronie saly gear hill sed sear, you could be seriously inju
. WARNING: Bicycles and bicycle parts have limitations with regard to strength ind integrity, and this type of riding can exceed those limitations or dramatically reduce the length of their safe use.
erecommend against this type of riding because of the increased risks; but if you choose to take the risk, at least:

Take lessons from a competent instructor first.

- Start with easy learning exercises and slowly develop your skills before trying more difificult or dangerous riding.

Use only designated areas for stunts, jumping, racing or fast downhill riding. - Wear a full face helmet, safety pads and other safety gea

- Understand and recognize that the stresses imposed on your bike by this kind of activity may break or damage parts of the bicycle and void the warranty.
- Take your hicycle to PROPPAIN or your hicycle dealerif anything breaks or bends. Do not ride your bicycle when any part is damaged.
- If your ride downhill at speed, do stunt riding or ride in competition, know the limits of your skill and experience. Ultimately, avoiding iniury is your responsibility.

There are many components and accessories available to enhance the comfort, per formance and appearance of your bicycle. However, if you change components or add accessories, you do so at your own risk. The bicycle's manufacturer may not have tested that component or accessory for compatibility, reliabiity or safety on your bicycle. Before installing any component or accessory, including but not limited to a different size tire, a lighting system, a luggage rack, a child seat, a trailer, etc., make sure that it is compatible with your bicycle by with PROPAIN. Be sure to read, understand and follow the instructions that accompany the products you purchase for your bicycle. See also Appendix $B$, and $C$.
! WARNNG: Failure to confirm compatibility, properly install, operate and maintain any component or accessory can result in serious injury or death.
\$ WARNING: Exposed springs on the saddle of any bicycle fitted with a child seat can cause serious injury to the child
! warning: Changing the components on your bike with other than genuine replacement parts may compromise the safety of your bicycle and may void the Wrraty Check with PROPAIN or your dealer before changing the components on your bike.

NOTE: Correct fiti is an essential element of bicycling safety, performance and comfort. Making the adjustments to your bicycle which result in correct fit for your body and riding conditions requires mechanic make the ajjustments on your bicycle; or, if you have the experience, skill and tools, have your PROPAIN or your dealer check your work before riding.
§ WARNNG: If your bicycle does not fit properly, you may lose control and fall. If your new bike doesn't fit, ask PROPAIN or a bicycle dealer to exchange it before you ride it

## A. STANDOVER HEIGHT

1. Diamond frame bicycle

Standover height is the basic element of bike fit (fig. 2). It is the distance from the ground to the top of the bicyclés frame at that point where your crotch is when straddling the bike. To check for correct standover height, stradale the bike while wearing the kind or shoes in wich youl be namg, and bounce vigorously on your heels. I your croc A. A bike which you ride only on paved surfaces and never take off-road should give you a minimum standover height clea-
rance of two inches ( 5 cm ). A bike that youll ride on unpave surfaces should give you a minimum of three inches 7.5 cm )
 road should give you four inches ( 10 cm ) or more of clearance
2. Step-through frame bicycles

Standover height does not apply to bicycles with step-through frames. Instead, the limiting dimension is determined by saddle height range. You must be able to adjust your saddle position as described in $B$ without exceeding the limits set by the height of the op of the seat tube and the "Minimum Insertion" or "Maximum Extension" mark on the seat post.

## . SADDLE POSITION

Correct saddle adjustment is an important factor in getting the most performance and comfort from your bicycle. If the saddle position is not comfortable for you, ask PROPPAIN r see your dealer.
The saddle can be adjusted in three directions:

1. Up and down adjustment. To check for correct saddle height (fig. 3):
a. sit on the saddle
b. place one heel on a pedal
c. rotate the crank until the pedal with your heel on it is in the down position and the crank arm is parallel to the seat tube.

If your leg is not completely straight, your saddle height needs to be adjusted. If your hips must rock for the heel to needs to be adjusted. If your hips must rock for the heel to the knee with your heel on the pedal, the saddle is too low.

Ask PROPAIN or a bicycle dealer to set the saddle for your optimal riding position and show you how to make this adjustment. If you choose to make your own saddle height adjustment:
loosen the seat post clamp
raise or lower the seat post in the seat tube
make sure the saddle is straight fore and aft

- re-tighten the seat post clamp to the recommended torque (Appendix E or the manufacturer's instructions).

Once the saddle is at the correct height, make sure that the seat post does not project trom the frame beyond its "Minimum Insertion" or "Maximum Extension" mark (fig. 4).

NOTE: Some bicycles have a sight hole in the seat tube, the purpose of which is to make it easy to see whether the seat post is inserted in the seat tube far enough to be safe. If your bicycle has such a sight hole, use it instead of the "Minimum Insertion" or "Maximum Extension" mark to make sure the seat post is inserted in the seat the far enough to be visible through the sight hole. If your bike has an interrupted seat tube, as is the case on some suspension bikes, you mustalso make sure that the seat post is far enough into the rameso that youcan touchit through the botom of the interthe frame so that you can touch it through the bottom of the interApted seat tube with the tip of your finger without inserting you

. WARNING: If your seat post is not inserted in the seat tube as described in B.1 above, the seat post, binder or even frame may break, which could cause you to lose control and fall.
2. Front and back adjustmeni.

The saddle can be adjusted forward or back to help you get the optimal position on the bike. Ask PROPAIN or a bicycle dealer to set the saddle for your optimal riding position and to show you how to make this adjustment. If you choose to make your own front and back adjustment, make sure that the clamp mechanism is clamping on the straight part of the saddle rails and is not touching the curved part of the rails, and that you are using the recommended torque on the clamping fastener(s)/Appendix E or the manufacturer's instructions)

## 3. Saddle angle adjustment:

Most people prefer a horizontal saddle; but some riders like the saddle nose angled up or downjust a little. PROPAIN or a bicycle dealer can adjust saddle angle or teach you how to do it. If you choose to make your own saddle angle adjustment and you have a single bolt saddle clamp on your seat post, it is critical that you loosen the clamp bolt sufficiently to allow any serrations on the mechanism to o issengage before changing the saddiles angle, nen that the seraions fily reingage before you tignten the borto the recmmended torque (Appendix Eor the mantecturer's instructions)

A WARNING: When making saddle angle adjustments with a single bolt saddle clamp, always check to make sure that the serrations on the mating surfaces le clamp, always check to make sure that the serrations on the mating surfaces
of the clamp are not worn. Worn serrations on the clamp can allow the saddle to move, causing you to lose control and fall. Always tighten fasteners to the correct torque. Bolts that are too tight can stretch and deform. Bolts that are too loose can
move and fatigue. Either mistake can lead to a sudden failure of the bolt, causing you to lose control and fall. Note: If your bicycle is equipped with a suspension or telescopic seat post, the suspension mechanism may require periodic service or maintenance. Ask PROPAIN or your dealer for recommended service intervals for your suspension or telescopic seat post.

Small changes in saddle position can have a substantial effect on performance and comfort. To find your best saddle position, make only one adjustment at a time.
§ WARNNG: After any saddle adjustment, be sure that the saddle adjusting mechanism is properly seated and tightened before riding. A loose saddlle clamp or seat post clamp can cause damage to the seat post, or can cause you to lose control and fall. A correctly tightened saddle adjusting mechanism will allow no saddle mo vement in any direction. Periodically check to make sure that the saddle adjusting mechanism is properly tightened.
If, in spite of carefully adjusting the saddle height, tilt and fore-and-aft position, you saddle is still uncomfortable, you may need a different saddle design. Saddles, like peo , com in many differerent shou may need a different saddle design. Saddles, like peo help you select a saddle which, when correctly adiusted for your body and rididng style will be comfortable.
. WARNING: Some people have claimed that extended riding with a saddle which is incorrectly adjusted or which does not support your pelvic area correctly can cause short-term or long-term injury to nerves and blood vessels, or even impotence. If your sadale causes you pain, numbness or other discomfort, listen to your body and stop riding until you contacted PROPAIN or your dealer about saddle adjustment or a different saddle.

## C. HANDLEBAR HEIGHT AND ANGLE

Your bike is equipped either with a "threadless" stem, which clamps on to the outside of the steerer tube, or with a "quill" stem, which clamps inside the steerer tube by way of an expanding binder bolt. If you aren't absolutely sure which type of tem your bike has, ask PROPAIN or your dealer. If your bike has alt 6) PROPAIN or your dealer may be able to change handlebar height by moving height djustment spacers from below the stem to above the stem, or vice versa . Otherwise, Ull have to get a stem of different length or rise. Consult PRPPAIN or your dealer. Do not attempt to do this yourself, as it requires special knowledge.

WARNIN: On some bicycles, changing the stem or stem height can affect the tension of the front brake cable, locking the front brake or creating excess cable slack which can make the front brake inoperable. If the front brake pads move in towards whed $\frac{1}{}$ out away from the wheel $r$ im when the stem or stem height is changed, the brakes must be correctly adjusted before you ride the bicycle.

Some bicycles are equipped with an adjustable angle stem. If your bicycle has an adustable angle stem, ask PRoPAIN or your dealer to show you how to adjust it. Do not attempt to make the adjustment yourself, as changing stem angle may also require adjustments to the bicycle's controls.

## 今 max

Winnc: Always tighten fasteners to the correct torque. Bolts that are too tight can stretch and deform. Bolts that are too loose can move and fatigue. Either can lead to a sudden failure of the bolt, causing you to lose control and fall.
RROPAIN or your dealer can also change the angle of the handlebar or bar end extensions.
. WARNNG: An insufficiently tightened stem clamp bolt, handlebar clamp bolt or bar end extension clamping bolt may compromise steering action, which could cause you to lose control and fall. Place the front wheel of the bicycle between your less and attempt to twist the handlebar/stem assembly. If you can twist the stem in .

1 wanna Beara sions to handlebars will change the steering and braking response of the bicycle.

## D. CONTROL POSITION ADJUSTMENTS

The angle of the brake and shift control levers and their position on the handlebars can be changed. Ask PROPAIN or your dealer to make the adjustments for you. If you choo se to make your own control lever angle adjustment, be sure to re-tighten the clam fasteners to the recommended torque (Appendix E or the manufacturer's instructions).

## E. BRAKE REACH

Many bikes have brake levers which can be adjusted for reach. If you have small hands or find it difficullt to squeeze the brake levers, PROPAIN or your dealer can either adjust
the reach or fit shorter reach brake levers.
A. WARNING: The shorter the brake lever reach, the more critical it is to have correctly adjusted brakes, so that full braking power can be applied within available brake lever travel. Brake lever travel insufficieint to apply full braking power can result in loss of control, which may result in serious injury or death
4. TECH

It's important to your safety, performance and enjoyment to understand how things work on your bicycle. We urge you to ask PROPAIN or your dealer how do the things described in this section before you attempt them yourself, and tha you have your dealer check your work before you ride the bike. If you have even the slightest doubt as to whether you understand something in this section of the Manual, talk to PROPAIN or your dealer. See also Appendix A, B, C, D and E.

## A. WHEELS

Bicycle wheels are designed to be removable for easier transportation and for repair a tire puncture. In most cases, the wheel axles are inserted into slots, called "dropouts" in the fork and frame, but some mountain and road bikes use what is called a athrough axle" wheel mounting system. If you have a mountain or road bike equipped with through axle front or rear wheels, make sure that PROPAIN or your dealer has given you the manuracturers instructions, and follow hose when installing or rem a lion 1 deale. Klo have wheels secured in one of three ways:

1. A hollow axle with a shaft ("skewer") running through it which has an adjustable tension nut on one end and an over-center cam on the other (cam action system, fig. 8 \& b b)

2. Ahollow axle with a shatt ("skewer") running through it which has a nut on one end and a fitting for a hex key, lock lever or other tightening device on the other (through bolt, fig. 9)

3. Hex nuts or hex key bolts which are threaded on to or into the hub axle (bolt-on wheel, fig. 10)

Your bicycle may be equipped with a different securing method for the front wheel than
for the rear wheel. Discuss the wheel securing method for your bicycle with PROPAIN your dealer.

It is very important that you understand the type of wheel securing method on your bicycle, that youknow how to secure the wheels correcily, and that you know how apply the correct clamping force that safely secures the wheel. Ask PROPAIN or your dealer to instruct you in correct wheel removal and installation, and ask him to give you any available manufacturer's instructions.
! WaRNING: Riding with an improperly secured wheel can allow the wheel to wobble or fall off the bicycle, which can cause serious injury or death. Therefore, it is essential that you:

1. Ask PROPAIN or your dealer to help you make sure you know how to install and remove your wheels safely.
2. Understand and apply the correct technique for clamping your wheel in place.
3. Each time, before you ride the bike, check that the wheel is securely clamped. The clamping action of a correctly secured wheel must emboss the surfaces of the dropouts.
4. FRONT WHEEL SECONDARY RETENTION DEVICES

Most bicycles have front forks which utilize a secondary wheel retention device to reduce the risk of the wheel disengaging from the fork if the wheel is incorrectly secured Secondary retention devices are not a substitute for correctly securing your front whee Secondary retention devices fall into two basic categories:
a. The clip-on type is a part which the manufacturer adds to the front wheel hub or front fork.
b. The integral type is molded, cast or machined into the outer faces of the fron fork dropouts. Ask PROPAIN or your dealer to explain the particular secondary retention device on your bike
. WARNNG: Do not remove or disable the secondary retention device. As its name implies, it serves as a back-up for a critical adjustment. If the wheel is no secured correctly, the secondary retention device can reduce the risk of the whee disengaging from the fork. Removing or disabing the secondary retention device
 wheel to woble or disen wid 1 wheel to wobble or disengage, ting in serious injury or death.

## 2. WHEELS WITH CAM ACTION SYSTEMS

There are currently two types of over-center cam wheel retention mechanisms: the traitional over-center cam (fig. 8a) and the cam-and-cup system (fig. 8b). Both use an ver-center cam action to clamp the bike's wheel in place. Your bicycle may have a cam-and-cup front wheel retention system and a traditional rear wheel cam action system.

## a. Adjusting the traditional cam action mechanism (fig. 8a)

The wheel hub is clamped in place by the force of the over-center cam pussing against one dropout and pulling the tension adjusting nut, by way of the skewer, against the other dropout. The amount of clamping force is controlled by the tension adjusting nut. Turring the tension adjusting nut clockwise while keeping the cam lever from rotating increases clamping force; turring it counterclockwise while keeping the cam lever from rotating reduces clamping force. Less than half a turn of the tension adjusting nut can make the difference between safe clamping force and unsafe clamping force.
WARNIN: The full force of the cam action is needed to clamp the wheel se-
2. WARNING: The full force of the cam action is needed to clamp the wheel se-
curely. Holding the nut with one hand and turning the lever like a wing nut with the curely. Holding the nut with one hand and turning the lever like a wing nut with the her hand und evening is as ight as you can get it will not clamp a cam
b. Adjusting the cam-and-cup mechanism (fig. 8b)

The cam-and-cup system on your front wheel will have been correctly ajjusted for your The cam-and-cup system on your front wheel will have been correctly adjusted for your鲑cle by PROPAIN or your dealer. Ask a bicycle dealer to check the aduustment every six months. Do not use a cam-and
for which your dealer adjusted it.

## 3. REMOVING AND INSTALLING WHEEL

\$ waRNING: If your bike is equipped with a hub brake such as a rear coaster brake, front or rear drum, band or roller brake; or if it has an internal gear rear hub, do not attempt to remove the wheel. The removal and re-instala 1 ost hub rakes and internal gear hubs requires special knowledge. Incorrect removal or assembly can result in brake or gear failure, which can cause you to lose control and fall.
. caution: If your bike has a disc brake, exercise care in touching the rotor or caliper. Disc rotors have sharp edges, and both rotor and caliper can get very hot during use.

Removing a disk brake or rim brake front whee

1. If your bike has rim brakes, disengage the brakés quick-release mechanism to increase the clearance between the tire and the brake pads S See Section $4 . C$ fig. 1 through 15 .
2. If your bike has cam action front wheel retention, move the cam lever from the locked or CLOSED position to the OPEN position (figs, $8 \mathrm{a} \& \mathrm{~b}$ ) If your bike has through bolt or bolt-on front wheel retention loosen the fasteners) a few turns counter-clockwise using an appropriate wrench, lock key or the integral lever.
3. If your front fork has a clip-on type secondary retention device, disengage it. If your front fork has an integral secondary retention device, and a traditional cam action System (fig. 8al loosen the tension adjusting nut enough to allow removing
the wheel from the dropouts. If your front wheel uses a cam-and-cup system, ffig. 8b) squeeze the cup and cam lever together while removing the wheel. No rotation of any part is necessary with the cam-and-cup system.
ray need to tap the top of the wheel with the palm of your hand to release the whee from the front fork.
b. Installing a disk brake or rim brake front wheel
\. cAUTION: If your bike is equipped with a front disk brake, be careful not to damage the disk, caliper or brake pads when re-inserting the disk into the caliper. Never activate a disk brake's control lever unless the disk is correctly inserted in the caliper. See also Section 4.C.
4. If your bike has cam action front wheel retention, move the cam lever so that it curves away from the wheel (fig. 8b). This is the OPEN position. If your bike has through bolt or bolt-on front wheel retention, go to the next step.
5. With the steering fork facing forward, insert the wheel between the fork blades so that the axle seats firmly at the top of the fork dropouts. The cam lever, if there bo the icycle(fig 8 \& \& b). If your bike has a clip-on type secondary retention device, engage it
6. If you have a traditional cam action mechanism: Holding the cam lever in the ADJUST position with your right hand, tighten the tension adjusting nut with your left hand until it is finger tight against the fork dropout (fig. 8a). If you have a cam-andcup system: the nut and cup (fig. 8b) will have snapped into the recessed area of the
fork dropouts and no adjustment should be required.
7. While pushing the wheel firmly to the top of the slots in the fork dropouts, and at he same time centering the wheel rim in the fork
. With a cam action system, move the cam lever upwards and swing it into the CLOSED position (fig. \& \& \& b). The lever should now be parallel to the fork blade and curved toward the wheel. To apply enough clamping force, you should have to wrap your fingers around the fork blade for leverage, and the lever should leave a clear imprint in the palm of your hand.
ii. With a through-bolt or bolt-on system, tighten the fasteners to the torque specifications in Appendix E or the hub manufacturer's instructions.

NOTE: If, on a traditional cam action system, the lever cannot be pushed all the wa to a position parallel to the fork blade, return the lever to the OPEN position. The turn the tension adjusting nut counterclockwise one-quarter turn and try tightenin the lever again.
\} WARNIN: Securely clamping the wheel with a cam action retention device takes considerable force. If you can fully close the cam lever without wrapping you fingers around the fork blade for leverage, the lever does not leave a clear imprint sufor surface this Section, p. 19.
5. If you disengaged the brake quick-release mechanism in 3. a. 1) above, re-engage it to restore correct brake pad-to-rim clearance.
6. Spin the wheel to make sure that it is centered in the frame and clears the brake pads; then squeeze the brake lever and make sure that the brakes are operating correctly.
c. Removing a disk brake or rim brake rear whee

1. If you have a multi-speed bike with a derailleur gear system: shift the rear deral leur to high gear (the smallest, outermost rear sprocket). If you have an internal gear rear hub, consult PROPAIN or your dealer or the hub manufacturer's instructions before attempting to remove the rear wheel. If you have a single-speed bike with rim or disk brake, go to step 4) below.
2. If your bike has rim brakes, disengage the brake's quick-release mechanism to increase the clearance between the wheel rim and the brake pads (see Section 4 . figs. 11 through 15).
3. On a derailleur gear system, pull the derailleur body back with your right hand.
4. With a cam action mechanism, move the quick-release lever to the OPEN position (fig. 8b). With a through bolt or bolt on mechanism, loosen the fastener(s) with an apropriate wrench lock lever or or integral lever then push the wheel forward far enough to be able to remove the chain from the rear sprocket.

5 Lift the rear wheel off the ground a few inches and remove it from the rea dropouts.
d. Installing a disk brake or rim brake rear wheel
 damage the disk, caliper or brake pads when re-inserting the disk into the caliper. Never activate a disk brake's control lever unless the disk is correctly inserted in the caliper.

1. With a cam action system, move the cam lever to the OPEN position (see fil 8 a \& b). The lever should be on the side of the wheel opposite the derailleur and freewheel sprockets.
2. On a derailleur bike, make sure that the rear derailleur is still in its outermost, high gear, position; then pull the derailleur body back with your right hand. Put the chain on top of the smallest freewheel sprocket.
3. On single-speed, remove the chain from the front sprocket, so that you hav plenty of slack in the chain. Put the chain on the rear wheel sprocket.
4. Then, insert the wheel into the frame dropouts and pull itall the way in to the dropouts.
5. On a single speed or an internal gear hub, replace the chain on the chainring: pul the whed hack in the dropouts so that it is straight in the frame and the chain has about $1 / 4$ inches of up-and-down play
6. With a cam action system, move the cam lever upwards and swing it into the CLOSED position (fig. 8 \& $b$ b). The lever should now be parallel to the seat stay or chain stay and curved toward the wheel. To apply enough clamping force, you should have to wrap your fingers around the fork blade for leverage, and the lever should leave a clear imprint in the palm of your hand.
7. With a through-bolt or bolt-on system, tighten the fasteners to the torque specif cations in Appendix E or the hub manufacturer's instructions.
NOTE: If, on a traditional cam action system, the lever cannot be pushed all the was to a position paralle to the seat stay or chain stay, return the lever to the OPEN pos tion. Then turn the tension adjusting nut counterclockwise one-quarter turn and try tightening the lever again.
A. WARNNG: Securely clamping the wheel with a cam action retention device takes considerable force. If you can fully close the cam lever without wrapping your fingers around the seat stay or chainstay for leverage, the lever does not leave aclea imprintinthe palmo fyour hand, and the serrationsonthe wheeifastenerdonotembos
 sion adjusting nut clockwise a quarter turn; thentry again. See also the first WARNNG this Section. p. 19 .
8. If you disengaged the brake quick-release mechanism in 3. c. 2) above, re-eng ge it to restore correct brake pad-t-r-rim clearance.
9. Spin the wheel to make sure that it is centered in the frame and clears the brake pads; then squeeze the brake lever and make sure that the brakes are operating. correctly.

## B. SEAT POST CAM ACTION CLAMP

Some bikes are equipped with a cam action seat post binder. The seat post cam action binder works exactly like the traditional wheel cam action fastener(Section 4.A.2). Whil a cam action binder looks like a long bolt with a lever on one end and a nut on the other the binder uses an over-center cam action to firmly clamp the seat post (see fig. 8a).
§ WARNING: Riding with an improperly tightened seat post can allow the saddle to turn or move and cause you to lose control and fall. Therefore:

1. Ask PROPAIN or your dealer to help you make sure you know how to correctly clamp your seat post.
2. Understand and apply the correct technique for clamping your seat post.
3. Before you ride the bike, first check that the seat post is securely clamped.

Adjusting the seat post cam action mechanism:
The action of the cam squeezes the seat collar around the seat post to hold the seat post securely in place. The amount of clamping force is controlled by the tension adjusting nut. Turning the tension adjusting nut clockwise while keeping the cam lever from rotnut. Iurning the tension adusting nut clockwise while keeping the cam lever from rot-
rom rotating reduces clamping force. Less than haff a turn of the tension adjusting nut tan make the difference between safe and unsafe clamping force.
WARNING: The full force of the cam action is needed to clamp the seat post securely. Holding the nut with one hand and turning the lever like a wing nut with the other hand until everything is as tight as you can get it will not clamp the seat post safely
WARNNG: If you can fully close the cam lever without wrapping your fingers around the seat post or a frame tube for leverage, and the lever does not leave a clear imprint in the palm of your hand, the tension is insufficient. Open the lever; turn the tension adjusting nut clockwise a quarter turn; then try again.

## C. BRAKES

There are three general types of bicycle brakes: rim brakes, which operate by squeeing the wheel rim between two brake pads; disc brakes, which operate by squeezing hub-mounted disc between two brake pads; and internal hub brakes. All three can be perated by way of a handebar mounted ever. On some models of bicycle, the internal led $d$ is described in Appendix 0 .
© mannm:

1. Riding with improperly adjusted brakes, worn brake pads, or wheels on which the rim wear mark is sisible is dangerous and can result in serious injury or death.
2. Applyingbrakestoohardortoosuddenlycanlockupawheel,whichcouldcause youtolosecontrolandfall. Suddenorexcessiveapplicationofthefrontbrakema pitch the rider over the handlebars, which may result in serious injury or death.
3. Some bicycle brakes, such as disc brakes (fig. 11) and linear-pull brakes (fig. 12), are extremely powerful. Take extra care in becoming familiar with these brakes and exercise particular care when using them.
4. Some bicycle brakes are equipped with a brake force 4. Someticycle erakes are equilped with a brake force
modulator, a small, cylindrical device through which the brake control cable runs and which is designed to provide a more progressive application of braking force. A modulator makes the initial brake lever force more gentle, progressively increasing force until full force is achieved. If your bike is equipped with a brake force modulator, take extra care in becoming familiar with its performance characterisbrakes, ar PROPAN or your der 5. Disc brakes can get extremely hot with extended use. Be careful not to touch a 5. Disc brakes can get extremely ho win extende
5. See the brake manufacturer's instructions for operation and care of your bra kes, and for when brake pads must be replaced. If you do not have the manufacturer's instructions, see your dealer or contact PROPAIN.
replacement parts.

## 1. BRAKE CONTROLS AND FEATURES

 It's very important to your safety that you learn and rememberwhich brake lever controls which brake on your bike. Traditionally, in the U.S. the right brake lever controls the rear brake and the left brake lever controls the front brake; but, to check how your bike's brakes are set up, squeeze one brake lever and look to see which brake, front or rear, engages. Now do the same with the other brake lever. Make sure that your hands can reach and squeeze the brake levers comfortably. If your hands are too small to operate the levers comfortably, consult PROPAIN or your dealer before riding the bike. The lever reach may be adjustable; or you may need a different brake lever design. Most rim brakes have some form quick-release mechanism to allow the brake pads to clear the tire when a wheel is removed or reinstalled. When the brake quich relase is in the open postion, he brakes are noperaive. Aas the rake yuick realese works on your bike (see figs. $12.13,148$ ) 1 . 1 . 1 . re both brakes work correctl| before you get on the bike.

The braking action of a bicycle is a function of the friction between the brakin surfaces. To make sure that you have maximum friction available, keep your whe rims and brake pads or the disk rotor and caliper clean and free of dirt, lubricants, waxes or polishes.
Brakes are designed to control your speed, not just to stop the bike. Maximum braking force for each wheel occurs at the point just before the wheel "locks up" (stops rotating) and starts to skid. Once the tire skids, you actually lose most of your stopping force and all directional control. You need to practice slowing and stopping smoothly without locking up a wheel. The technique is called progressive brake modulation. Instead of jerking the brake lever to the position where you thin you'll generate appropriate braking force, squeeze the lever, progressively increa sing the braking force. If you feel the wheel begin to lock up, release pressure just little to keep the wheel rotating just short of lockup. It's important to develop a fee for the amount of brake lever pressure required for each wheel at different speed and on different surfaces. To better understand this, experiment a little by walking your bike and applying different amounts of pressure to each brake lever, until the Wheel locks. When you apply one or bo wracs, body wants oo conine at espeed ar way cras go ng. This fres a
 will accent greater hrake pressure befor lockup a wheel with less weight will lock up with less brake pressure. So, as you apply brakes and your weight is transferred forward you need to shifty your body toward the rear of the bike, to transfer weigh back on to the rear whell and at the same time you need to both decrese rear braking and increase front traking force This is even more important on descents,
because descents shift weight forward. Two keys to effective speed control and safe stopping are controlling wheel lockup and weight transfer. This weight transfer is even more pronounced if your bike has a front suspension fork. Front suspension "dips" under braking, increasing the weight transfer (see also Section 4.F). Practice raking and weight transfer techniques where there is no traffic or other hazards and distractions. Everything changes when you ride on loose surfaces or in wet wether. It will take longer to stop on loose surfaces or in wet weather. Tire adhesion is reduced, so the wheels have less cornering and braking traction and can lock up with less brake force. Moisture or dirt on the brake pads reduces their ability to grip. The way to maintain control on loose or wet surfaces is to go more slowly.

## SHIFTING GEARS

Kour mult-speed bicycle will have a derailleur drivetrain (see 1. below), an internal gear hub drivetrain (see 2 . below ) or, in some special cases, a combination of the two.

## HOW A DERAII EUR DRIVETRAIN WORKS

If your bicycle has a derailleur drivetrain, the gear-changing mechanism will have
a rear cassette or freewheel sprocket clustern
a rear derailleur
usually a front derailleur

## one or two shifters

one, two or three front sprockets called Chainrings
a drive chain

## a. Shirting Gears

here are several different types and styles of shifting controls: levers, twist grips, triggers, combination shift/brake controls and push-buttons. Ask PROPAIN or your dealer to explain the type of shifting controls that are on your bike, and to show you how they work. The vocabulary of shifting can be pretty confusing. A downshift is a shift to a "lower" or "slower" gear, one which is easier to pedal. An upshift is a shift to a "higher" or "faster", harder to pedal gear. What's confusing is that what's happening at the front derailleur is the opposite of what's happening at the rear derailleur for details, read the instructions on Shifting the Rear Derailleur and Shifting the Front Derailleur below). For example, you can select a gear which will make pedaling easier on a hill (make a . the ront, or up the gear steps" lo alaryer gear at he rear. So, at he rear gear cluster, rer that shifting the chain in owards the .

解 der $A$ dill
! caution: Never move the shifter while pedaling backward, nor pedal back wards immediately after having moved the shifter. This could jam the chain and cause serious damage to the bicycle.

## b. Shitting the Rear Derailleur:

The rear derailleur is controlled by the right shifter. The function of the rear derailleur is to move the drive chain from one gear sprocket to another. The smaller sprocket on the gear cluster produce higher gear ratios. Pedaling in the higher gears requires greater pedaling effort, but takes you a greater distance with each revolution of the pedal cranks. The larger sprockets produce lower gear ratios. Using them requires less pedaling effort, but takes you a shorter distance with each pedal crank revolution. Moving the chain from a smaller sprocket of the gear cluster to a larger sprocket results in a downshift. Moving the chain from a larger sprocket to a smaller sprocket results in ain from one sprocket to another, the ider must be pedaling forward.

## c. Shitting the Front Derailleur:

The front derailleur, which is controlled by the left shifter, shifts the chain betwee the larger and smaller chainrings. Shifting the chain onto a smaller chainring make pedaling easier (a downshift) Shifting to a larger chainring makes pedaling harder (an upshift).

## d. Which gear should I be in?

The combination of largest rear and smallest front gears (fig. 16) is for the steepest
hills. The smallest rear and largest front combination is for the greatest speed. It is no necessary to shift gears in sequence. Instead, find the "starting gear" which is righ for your level of ability - a gear which is hard enough for quick acceleration but eas enough to let you start from a stop without wobbling - and experiment with upsh ting and downshifting to get a feel for the different gear combinations. At first, practice shifting where there are no obstacles, hazards or other traffic, until you've built up your confidence. Learn not to use either the "smallest to smallest" or "largest to largest" gear combinations because they may cause unacceptable stress on th drive train. Learn to anticipate the need to shift, and shift to a lower gear before the hill gets too steep. If you have difficulties with shifting, the problem could be mechanical adjustment. Please contact PROPAIN or your dealer for help.
\$ WARNNG: Never shift a derailleur onto the largest or the smallest sprocket the derailleur is not shitting smoothly. The derailleur may be out of adjustment and the chain could jam, causing you to lose control and fall.

## e. What if it won't shift gears?

If moving the shift control one click repeatedly fails to result in a smooth shift to the nex gear, chances are that the mechanism is out of adjustment. Take the bike to PROPAIN or a bicycle dealer to have it adjusted.

## 2. HOW AN INTERNAL GEAR HUB DRIVETRAIN WORKS

y your bicycle has an internal gear hub drivetrain, the gear changing mechanism will consist of:

A3, 5, 7, , 12 speed or possibly an infinitely variable internal gear hub
one, or sometimes two shifters
one or two control cables
one front sprocket called a chainring
a drive chain
Shitting internal gear hub gears
Shifting with an internal gear hub drivetrain is simply a matter of moving the shifter to the indicated position for the desired gear ratio. After you have moved the shifter to the gear position of your choice, ease the pressure on the pedals for an instant to allow the gear position of your choic

## . Which gear should I be in?

The numerically lowest gear ( 1 ) is for the steepest hills. The numerically largest gear is for the greatest speed. Shifting from an easier, "slower" gear (like 1) to a harder, "faster" gear (like 2 or 3) is called an upshift. Shifting from a harder, "faster" gear to an "asier "slower" gearis called a downshift It is not necescsary to shift gerrs in sequen-
ce. Instead, find the "starting gear" for the conditions - a gear which is hard enough for quick acceleration but easy enough to let you start from a stop without wobbling - and experiment with upshifting and downshifting to get a feel for the different geas. At first, practice shifting where there are no obstacles, hazards or other tratic, until you've built up your confidence. Learn to anticipate the need to shift, and shift a lower gear before the hill gets too steep. If you have difficulties with shifting, the problem could be mechanical adjustment. Contact PROPAIN or your dealer for help.

## c. What if it won't shift gears?

If moving the shift control one click repeatedly fails to result in a smooth shift to the next gear chances are that the mechanism is out of adjustment. Take the bike to a bicycle dealer to have it ajjusted.

## E. PEDALS

1. Toe Overlap is when your toe can touch the front wheel when you turn the handlebars to steer while a pedal is in the forwardmost position. This is common on small-framed bicycles, and is avoided by keeping the inside pedal up and the outside aptern On by bicycle, this technique will also pre-ver the inside pedal from striking the ground in a turn.

## NOTE: Changing tire size or pedal crank arm length affects toe overlap.

## \$. WARNING: Toe Overlap could cause you to lose control and fall. Ask PROPAIN

 ry your dealer to help you determine if the combination of frame size, crank amlength, pedal design and shoes you will use results in pedal overlap. Whether you have overlap or not, you must keep the inside pedal up and the outside pedal down when making sharp turns.
2. Some bicycles come equipped with pedals that have sharp and potentially dangerous surfaces. These surfaces are designed to add safety by increasing grip between the rider's shoe and the pedal. If your bicycle has this type of high-performance pedal, you must take extra care to avoid serious injury from the pedals's sharp sur-faces. Based on your riding style or skill level, you may prefer less aggressive pedal design, or chose to ride with shin pads. PROPAIN or your dealer can show you a number of options and make suitable recommendations.
3. Toeclips and straps are a means to keep feet correctly positioned and engaged with the pedals. The toeclip positions the ball of the foot over the pedal spindle, which gives maximum pedaling power. The toe strap, when tightened, keeps the foot engaged throughout the rotation cycle of the pedal. While toeclips and straps give some benefit with any kind of shoe, they work most effectively with cy-cling shoes designed for use with toeclips. PROPAIN or your deal-er can explain how toeclips and straps work. Shoes with deep treaded soles or welts which might make it more diff
\. WARNING: Getting into and out of pedals with toeclips and straps requires WANNG. Geting into and out of pedals with toeclips and straps require skill which can only be acquired with practice. Until it becomes a reflex action, cause you to lose control and fall. Practice the use of toeclips and straps where there are no obstacles, hazards or traffic. Keep the strans loose and don't tiob en them until your technique and confidence in getting in and out of the pedals

## warrants it. Never ride in traftic with your toe straps tigh.

4. Clipless pedals (sometimes called "step-in pedals") are another means to kee feet securely in the correct position for maximum pedaing efficiency. They have plate, called a "cleat," on the sole of the shoe, which clicks into a mating spring-loa which must be practiced until it becomes instinctive. Clipless pedals require sho es and cleats which are compatible with the make and model pedal being used.
\ WARNUNG: Klickpedale sind für die Verwendung mit speziell dafür angefer tigten Schuhen bestimmt und wurden entwickelt, um den Fuß fest auf dem Pedal zu fixieren. Verwende keine Schuhe, bei denen keine korrekte Fixierung auf dem Pedal möglich ist.
Many clipless pedals are designed to allow the rider to adjust the amount of force nee ded to engage or disengage the foot. Follow the pedal manufacturer's instructions, ask PRopaln or your dealer to show you how to make this adjustment. Use the easies setting until engaging and disengaing becmes a reflex action but aways make sur that ther is sufficient tension to prevent unintended release of your foot from the ped
\. WARNNG: Clipless pedals are intended for use with shoes specificilly made to fit them and are designed to firmly keep the foot engaged with the pedal. Do not use shoes which do not engage the pedals correctly

Practice is required to learn to engage and disengage the foot safely. Until engaging and disengaging the foot becomes a reflex action, the technique requires concentration which can distract your attention and cause you to lose control and fall. Practice enga-
traftic; and be sure you do not have the manufacturer's instructions, see your dealer or contact PROPAIN.

## . BICYCLE SUSPENSION

Many bicycles are equipped with suspension systems. There are many different types of suspension systems - too many to deal with individually in this Manual. If your bicycle has a suspension system of any kind, be sure to read and follow the suspension manufacturer's setup and service instructions. If you do not have the manufacturer's instructions, see your dealer or contact PROPAIN.
A. WARNNG: Failure to maintain, check and properly adjust the suspension system may result in suspension malfunction, which may cause you to lose control and fall.

If your bike has suspension, the increased speed you may develop also increases your sk of injury. For example, when braking, the front of a suspended bike dips. You could ose control and fall if you do not have experience with this system. Learn to handle your suspension system safely. See also Section $4 . \mathrm{C}$

WARNNG: Changing suspension adjustment can change the handling and braking characteristics of your bicycle. Never change suspension adjustment unless you are thoroughly familiar with the suspension system manuracturer's instructions and recommendations, and always check for changes in the handing and

## careful test ride in a hazard--rree area

Suspension can increase control and comfort by allowing the wheels to better follow the terrain. This enhanced capability may allow you to oride faster; but you must not confuse the enhanced capabilities of the bicycle with your own capabilities as a rider. Increasing your skill wiil take time and practice. Proceed carefilly until you have learned to handle the full capabilities of your bike.
. WARNNG: Not all bicycles can be safely retrofitted with some types of susension systems. Before retrofitting a bicycle with any suspension, check with the bicycle's manufacturer to make sure that what you want to do is compatible with the bicycle's design. Failing to do so can result in catastrophic frame failure.

## G. TIRES AND TUBES

\$ WARNNG: Some bicycles intended for competition are fitted with tires which are glued on to specially made rims. These are called "sew-up" or "tubular" tires. roperly mounting these tires requires specialized knowledge and skills. Ask PRO, .

Tires

Conditions. If, once you've gained experience with your new bike, you feel that a differen tire might better suit your riding needs, PROPAIN or your dealer can help you select the most appropriate design. The size, pressure rating, and on some high-performance tires the specific recommended use, are marked on the sidewall of the tire (see fig. 177). The part of this information which is most important to you is Tire Pressure. But some wheel rim manufacturers also specify ma-
ximum tire pressure with a label on the rim.
WARNING: Never inflate a tire beyond the maximum pressure marked on the tire's sidewall or the wheel rim. If the maximum pressure rating for the wheel rim is to wer than the maximum pressure shown on the tire, always use the lower rating. Exceeding the recommended maximum pressure may blow the tire off the rim or damage the wheel rim, which could cause damage to the bike and injury to the rider and bystanders.

Tire pressure Mountain Bikes $\begin{array}{lll} & \\ \text { Bar } & \text { PSI } & \text { Kilopascal }\end{array}$

The best and safest way to inflate a bicycle tire to the correct pressure is with a bicycle pump which has a built-in pressure gauge.
A. WARNIN: There is a safety risk in using gas station air hoses or other air WARNNG: There is a safety risk in using gas station air hoses or other air
compressors. They are not made for bicycle tires. They move a large volume of air
very rapidly, and will raise the pressure in your tire very rapidly, which could cause the tube to explode.

Tire pressure is given either as maximum pressure or as a pressure range. How a tire performs under different terrain or weather conditions depends largely on tire pressure. Inflating the tire to near its maximum recommended pressure gives the lowest rolling resistance; but also produces the harshest ride. High pressures work best on smooth, dry pavement. Very low pressures, at the bottom of the recommended pressure range, give the best performance on smooth, slick terrain such as hard-packed clay, and on deep, loose surfaces such as deep, dry sand. Tire pressure that is too low for your weigh deep, looses surfacess such has deep, dry sand. Iire pressure that is tool ow for your weigh
and the riding conditions can cause puncture of the tube by allowing the tire to deform sufficiently to pinch the inner tube between the rim and the riding surface.
A caution: Pencil type automotive tire gauges can be inaccurate and should not be relied upon for consistent, accurate pressure readings. Instead, use a high-quality dial gauge.

Ask PROPAIN or your dealer to recommend the best tire pressure for the kind of riding you will most often do, and have a bicycle dealer inflate your tires to that pressure. Then check inflation as described in Section I.C so youll know how correctyy inflated ires shir 3 ressurever 3 brought up to pressure every week ortwo, So it is mporant toc check your tire pressures read pettern is tread patten is designed to work beter in one direction than in the other. The sidew If your bike has unidirectional trises be sure that they aremouted to rote in the corre direction.
2. Tire Valves

There are primarily two kinds of bicycle tire valves: The Schraeder Valve and the Presta Valve. The bicycle pump you use must have the fitting appropriate to the valve stems on your bicycle. The Schraeder valve (fig, 8a) is like the valve on a car tire. To inflate a Schraeder valve tire, remove the valve cap and clamp the pump fitting onto the end of the valve stem. To let air out of a Schraeder valve, depress the pin in the end of the valve stem with the end of a key or another appropriate object. The the valve stem with the end of a key or another appropriate object. The
Presta vavive (fig. 18b) has a narrower diameter and is only found on Presta valve (fig. 180 ) has a narrower diameter and is only found on
bicycle tires. To inflata a Presta valve tire using a Presta headed bicyle pump, remove the valve cap; unscrew (counterclockwise) the valve stem lock nut; and push down on the valve stem to free it up. Then push the pump head on to the valve head, and inflate. To inflate a Presta valve with a Schraeder pump fiting, you'l need a Presta adapter (available at your bike shop) which screws on to the valve stem once you've freed up the valve. The adapter fits into the Schraeder pump fitting. Close the valve after inflation. To let air out of Presta valve, open the valve stem lock nut and depress the valve stem.
. WARNING: We highly recommend that you carry a spare inner tube when you ride your bike, unless the bike is fitted with tubeless tires. Patching a tube is an ride your bike, unless the bike is fitted with tubeless tires. Patching a tube is an
emergency repair. If you do not apply the patch correctly or apply several patches, emergency repair. II you do not apply the patch correctly or apply several patches,
the tube can fail, resulting in possible tube failure, which could cause you to lose control and fall. Replace a patched tube as soon as possible.

## 5. SERVICE

! WARNNG: Technological advances have made bicycles and bicycle components more complex, and the pace of innovation is increasing. It is impossible for tis manual to provide all the information required to properly repair and/or mainin your bicycle. In order to help minimize the chances of an accident and possible njury, it is critical that you have any repari or maintenance which is not specifically described in this manual performed by PROPAIN or a bicycle dealer. Equally important is that your individual maintenance requirements will be determined by everything from your riding style to geographic location. Consult PROPAIN or your dealer or help in determining your maintenance requirements.
! WARNING: Many bicycle service and repair tasks require special knowledge and tools. Do not begin any adjustments or service on your bicycle until you have earned from PROPAIN or your dealer how to properly complete them. Improper adjustment or service may result in damage to the bicycle or in an accident which can cause serious injury or death.

If you want to learn to do major service and repair work on your bike;

1. Ask PROPAIN or your dealer for copies of the manufacturer's installation and ser vice instructions for the components on your bike, or contact the component manufacturer.
2. Ask RKOAN or your dealer to recormmend a book on bicycle repar.
3. PROPAIN or your dealer about the availability of bicycle repair courses in your area.
.enn du lernen möchtest, wie du größere Service- und Reparaturarbeiten an deinem Fahrrad sellbst durchführen kannst

We recommend that you ask PROPAIN or your dealer to check the quality of your work he first time you work on something and before you ride the bike, just to make sure that you did everything correctly. Since that will require the time of a mechanic, there may

 the to $r$ replace such parts when they require replacement.
A. SERVICE INTERVALS

Some service and maintenance can and should be performed by the owner, and requir no special tools or knowledge beyond what is presented in this manual. The following are examples of the type of service you should perform yourself. All other service, maintenance and repair should be performed in a properiy equipped facility by a qualifies bicycle mechanic using the correct tools and procedures specified by the manufacture.

1. Break-in Period: Your bike will last longer and work better if you break it in be fore riding it hard. Control cables and wheel spokes may stretch or "seat" when a new bike is first used and may require readjustment by PROPAIN or your dealer. Your Mechanical Safety Check (Section 1.C) will help you identify some things that need readjustment. But even if everything seems fine to you, it's best to take your bike back to a bicycle dealer for a checkup. Dealers typically suggest you bring th bike in for a 30 day checkup. Another way to judge when it's time for the first che ckup is to bring the bike in after three to five hours of hard off-rood use, or about to 15 hours of on-road or more casual off-road use. But if you think something 2. Before every ride: Mechanical Safety Check (Section 1.c)
2. After every long or hard ride; if the bike has been exposed to water or griti or at least every 100 miles: Clean the bike and lightyl lubricate the chain's rollers with good quality bicycle chain lubricant. Wipe off excess lubricant with a lint-fre cloth. Lubrication is a function of climate. Talk to PROPAIN or your dealer about the best lubricants and the recommended lubrication frequency for your area
3. After every long or hard ride or atter every 10 to 20 hours of riding squeeze the front brake and rock the bike forward and back. Everything feel solid? If you feel a clunk with each forward or backward movement of the bike, you probably have a loose headset. Have a bicycle dealer check it.
ift the front wheel off the ground and swing it from side to side. Feel smooth? y you feel any binding or roughness in the steering, you may have a tight headset. Have a bicycle dealer check it.
Grab one pedal and rock it toward and away from the centerline of the bike; Grab one pedal and rock itt oward and away from the centerline of the
then do the same with the other pedal. Anything feels loose? If so, contact PROPAIN or have a dealer check it.
Take a look at the brake pads. Starting to look worn or not hitting the wheel rim squarely? Time to adjust or replace them. Contact PROPAIN or have a dealer to eplace them.
Carefully check the control cables and cable housings. Any rust? Kinks? raying? If so, have a bicycle dealer replace them.
queeze each adjoining pair of spokes on either side of each wheel between your thumb and index finger. Do they all feel about the same? If any feel loose

ss wear cuts or bruises. Have a bicycle dealer replac
hem if necessary.
eck the wheel rims for excess wear, dings, dents and scratches. Consult PPO
PAIN or a bicycle dealer if you see any rim damage.
heck to make sure that all parts and accessories are still secure, and tighten any which are not.
any which are not. he stem and the seatpost for any deep scratches, crack or discloration The
se are signs of stress-caused faitue and indicate that a part is at the end of its useful life and needs to be replaced. See also Appendix C.
4. Disc brakes require a different set of inspection steps. Check for these issues before every ride
Pads rubbing on rotors
Worn out pads (which can lead to over-extended pistons)
Pistons that are stuck and/or won't retract fully.

- Disc rotors that are bent and need straightening by a certified bike mechanic. - Hydraulic brakes that feel sponge-y and/or levers that can be depressed all the way to the grips w/o generating adequate stopping power (due to trapped air and/or leaks.
A ject to wear and stress. Different materials and mechanisms wear or fatigue from stress at different rates and have different life cycles. If a component's life cycle is exceeded, the component can suddenly and catastrophically fail, causing serious injury or death to the rider. Scratches, cracks, fraying and discoloration are signs of ress-caused faigue and indicate inata part is at the end of tis usetulinie and needs to ereplace. Whe he ma ma and worshp ryor biccle or mivual mprers this is no euarantee that the product will last the term of the warraProduct if if is often related to the kind of riding you do and to the treatmen to which
 cannot be broken or will las f forever. It only means that the bicycle is covered subiect the terms of the warranty. Please be sure to read Appendix B, Intended Use of your bicycle and Appendix C, the lifespan of your bike and its components.

6. As required: If either brake lever fails the Mechanical Safety Check (Section I.C), don't ride the bike. Have a bicycle dealer or PROPAIN check the brakes. he chain wont shit smoolly and qiell fom gear to gear, the derailieur is out of adjustment. See PROPAIN or a bicycle dealer.
7. Every 25 (hard off-road) to 50 (on-road) hours of riding: Take your bike to a bicycle dealer for a complete checkup.

## B. IF YOUR BICYCLE SUSTAINS AN IMPACT

First, check yourself for injuries, and take care of them as best you can. Seek medica help if necessary. Next, check your bike for damage. After any crash, take your bike to PROPAIN or a bicycle dealer for a thorough check. Carbon composite components, including fames, wheels, handlebars, stems, cranksets, brakes, etc. which have sustained an impact must not be ridden until they haus ind issembled and thoroughly inspect mpact must ne
I. waRNING: A crash or other impact can put extraordinary stress on bicycle components, causing them to fatioue prematurely. Components suffering from stress fatigue can fail suddenly and catastrophically, causing loss of control, serious injury or death.

## APPENDIX A

EACHING YOURCHLL THE RULES
In addition to The Basics, Riding Safely, Off Road Safety, Wet Weather Riding, Night Riding, Bicycling in Traffic, and Downhill, Stunt and Competition Biking, described in this manual, kids need to be taught.... and to have frequently reinforced ...t the following rules and lessons which adults are arready expected to know. We urge you to take the time to familiarize yourself with these rules and to teach them to your child before you let your child ride unsupervised.

## 1. Rules

No playing in the road or in the street.
No riding on busy streets.
No riding at dawn, dusk or a t night.
Ride on the right of traftic.

## 2. Lessons

The lessons that follow relate to some of the most common real situa-tions that chidre encounter when riding their bikes. Go over these situations with your child and make sure the lesson objective is accomplished.
a. Driveway Rideout

When a youngster rides out of the driveway and is struck by a car, that is called a rideout accident.

What can you do? First, realize the danger of your own driveway. If there are obstruc-tions to the view of passing motorists (like bushes or trees), trim them back. You might park your car in front of the driveway, if local ordi-nance permits. This way, your child can't use the driveway as a launching pad. But the most important thing you can do is each your child about driveway safety. Take your child outside to the driveway and have $\mathrm{him} /$ her practice the following steps:
Stop before entering the street.
) Look left, right and left again for traffic.
2) Look left, right and leff again for traffic.
3)

## b. Running a Stop Sign

Car/bike crashes can happen when a cyclist runs a stop sign. Most cyclists who get hit iding through stop signs know that they were supposed to stop. They just thought it eror they may have been distracted. The thing to impress upon your child is that while he/she may not get hit every time, running stop signs will eventually esult in an accident.

What can you do? Take your child to a stop sis neer home Explain what it menc by emphasizing the following points
Stop at all stop signs, regardless of what is happening.
) Look in all directions for traffic.
3) Watch for oncoming cars making left turns. 4) Watch for cars behind you making right turns. 5) Wait for any crosst traffic to clear.
6) Proceed when safe.
order to make this lesson stick, you may have to change your own driving habits. If you reep through intersections controlled by stop signs, you are showing your child that you don't really believe what you preach. For your child's sake, stop at stop signs.

## c. Turning Without Warning

Another major accident type involves cyclists who make unexpected left turns. They either look behind for traffic, nor do they signal. The key factor here is neglecting to bok to the rear. If the cyclist had looked, he/she would have seen the danger coming up from behind.

What can you do? of course, you ought to teach your child not to ride across busy streets - at least until the child has had some advanced training and is old enough to aild to always look and signal hefore, turning lest A bit part of thi socson is teach youn thild how to lok to the rear without swerw Tak our chid to aby a 10 or rina Sto ter thechild dides by Call hisher nam. Ater 15 mintes of procices ater居 ould be able tolook behind his/herself and identify how many fingers you are holding up - without swerving.

## d. Riding at Dawn, at Dusk or at Night

(See also Section 2.E). Most car/bicycle accidents happen at night where an overtaking car hits a bike. (An overaking car is one that comes up from behind and passes the cyclist on the left.) These overtaking accidents can be very serious.

What can you do? First, you should keep your youngster from riding at dawn, dusk or a night. It requires special skills and equipment. Few children have either. Secondly, make sure your child understands that if he/she gets caught out at dusk or after dark on bike, the thing to do is to call you for a ride home. One suggestion is to have your child carry a cell phone, and as an added precaution, tape a phone number to the bike so that, in an emergency, an adult will be able to call home.

## e. Following the Leader

There is increased risk of car/bike collision if children are following each other, becaus if the first one does something dangerous, those following may do it too.

What can you do? Teach your child to always assess the traffic situa-tion for him/herself. When a group is riding around, each cyclist should stop for stop signs; each cyclist and look to the rear before making left turns; and so on. One way to get the messas
 d. 1 , Thits Chidrren need to learn to think for themselves to ride safely.

## UMMARY: Teach your child early - the earlier the better. Learning skills such

 looking and avoiding hazards takes time. Be prepared to repeatlessons until your child understands what yourre trying to get across. Be patient. Your efforts will be rewarded, knowing that your child is aware of safe riding skills.

## APPENDIX B

INTENDED USE OF YOUR BICYCLE
! WARNNG: Understand your bike and its intended use. Choosing the wrong bicycle for your purpose can be hazardous. Using your bike the wrong way is dan

## gers.

No one type of bicycle is suited for all purposes. Your retailer can help you pick the "right tool for the job" and help you understand its limitations. There are many types of bicycles and many variations within each type. There are many types of mountain, road, racing, hybrid, touring, cyclocross and tandem bicycles. There are also bicycles that mix features. For example, there are road/racing bikes with triple cranks. These bikes have the low gearing of a touring bike, the quick handling of a racing bike, but are not well suited for carrying heavy loads on a tour. For that purpose, you want a touring bike. With each or ype or bycle, one can opimize for cerain purposes. Vith your bicyle sho
 formance of bicycle for certain purpose On the following exes weseraly outi the intended uses of various types of bikes. Industry usage conditions are and evolving. Consult PROPAIN about how you intend to use your bike.

PROPAIN BICYCLES ARE DESIGNED AND TESTED FOR A MAXIMUM RIDER WEIGHT (IN- HIGH-PERFORMANCE ROAD LUNDING BAGGAGE) OF 264LBS/120KG.
all propain kids bicycles having $20^{\circ}$ Wheel siz are designeo and tested for MAXIMUM RIDER WEIGHT (INCLUNDING BAGGAGE) OF 88LBS/4OKG.
all propain juvenle bicycles having $24^{\prime \prime}$ or $26^{\prime \prime}$ Wheel size are designed and tested for a maximu rider weight (inclunding bagcage) of liglbs/8okg. lose ground contact.

INTENDED: To be ridden on paved roads only.

- CONDITION 1 : Bikes designed for riding on a paved surface where the tires do not

NOT INTENDED: For off-road, cyclocross, or touring with racks or panniers.

- TRADE OFF: Material use is optimized to deliver both
light weight and specific perfor-mance. You must understand that (1) these types of bikes are intended to give an aggres-sive racer or competitive cyclist a performance advantage over a relatively short product life, (2) a less aggressive rider will enjoy longer frame life, (3) you are choosing light weight (shorter frame life) over more frame
 weight and a longer frome life (4) you re choosing list resistant or run-ged frames that weighe more All frames weight over more dent resistant or rug-ged frames that weigh more. All frames that are very light need They insperin. Rese

GENERAL PURPOSE RIDING

- CONDITION 2: Bikes designed for riding Condition 1 , plus smooth gravel roads and improved trails with moderate grades where the tires do not lose ground contact.

INTENDED: For paved roads, gravel or dirt roads that are in good condition, and bike paths.

NOT INTENDED: For off-road or mountain bike use, or for any kind of jumping Some of these bikes have suspension features, but these features are designed to add comfort, not off-road capability. Some come with relatively wide tires that are well suited to gravel or dirt paths. Some come with relatively narrow tires that are best suited to faster riding on pavement. If you ride on gravel or dirt paths, carry heavier loads or want more tire durability talk to PROPANN about wider tires.

## CROSS-COUNTRY, MARATHON, HARDTAILS

CONDITION 3: Bikes designed for riding Conditions 1 and 2 , plus rough trails, smal obstacles, and smooth technical areas, in-cluding areas where momentary loss tire contact with the ground may occur. NOT jumping. Al mountain bikes without rear suspension are Condition 3 , and so are some lightweight rear suspension models.

- INTENDED: For cross-country riding and racing which ranges from mild to ac-gres-sive over intermediate terrain (e. g , hilly with small obstacles like roots, rock loose surfaces and hard pack and depressions). Cross-country and marathon equip-
ment (tires, shocks, frames, drive trains) are light-weight, avoring nimble speed over brute force. Suspension trave s relatively short since the bike is intended to move quickly on the ground.

NOT INTENDED: For Hardcore Freeriding, Extreme Downhill, Dirt Jumping, Slope-style, or very aggressive
 extreme rict
obstacles.

TRADE OFF: Cross-Country bikes are lighter, faster to ride uphill, and more nim-b than All-Mountain bikes. Cross-Country and Marathon bikes trade off some rug-gedness for pedaling efficiency and uphill speed.

## ALL-MOUNTAIN

CONDITION 4 : Bikes designed for riding Conditions 1,2 and 3 plus rough technical areas, moder--atly sized obs acles, and small jumps.

INTENDED: For trail and uphill riding. All-Mountain b cycles are: (1) more heavy duty than cross country bike Theride bives (2) lighter and ar than a cross country bike, alowing them to be rid-den in more difficullt terrain over larger ob-stacles and moderate jumps, (4) intermedi-ate in suspension
travel and use compo-nents that fit the intermediate intended use, (5) cover a fairly wide range of intended use, and within this range are models that are more or less heavy duty. Talk to your retailer about your needs and these mod-els.

- NOT INTENDED: For use in extreme forms of jumping/riding such as hardcore mountain, Freeriding, Downhill, North Shore, Dirt Jumping, Hucking etc. No large drop offs, jumps or launches (wooden structures, dirt embankments) requiring long suspension travel or heavy duty com-ponents; and no spending time in the air landing hard and hammering through ob-stacles.
- TRADE OFF: All-Mountain bikes are more rugged than cross country bikes, for riding more difficicult terrain. All-Mountain bikes are heavier and harder to ride uphill than cross country bikes. All-Mountain bikes are light-er, more nimble and asier to ride uphill than Freeride bikes. All-Mountain bikes are not as rugged as Freeride bikes and must not be used for more extreme riding and terrain.

## GRAVITY, ENDURO, FREERIDE, AND DOWNHILI

CONDITION 5: Bikes designed for jump-ing, hucking, high speeds, or aggressive riding on rougher surfaces, or landing on flat surfaces. However, this type of riding is extremely hazardous and puts unpredicta-ble forces on a bicycle which may overload the frame, fork, or parts. If you choose to to ride in Condition 5 terrain, you should take appropriate safety precautions such as more frequent dike inspections take appropriate safety preat ons such as more frequent preneve safty airment such as a full fice hilmet pots and bidy amor

- Intended: For riding that includes the most difficult terrain that only very skilled riders should attempt. Gravity, Enduro, Freeride, and Downhill are terms which describe hardcore mountain, north shore, slopestyle. This is "extreme" riding and the terms describing it are con-stantly evolving. Gravity, Enduro, Freeride, and Down hill bikes are: (1) heavier and have more sus-pension tra vel than All-Mountain bikes, al-owing them to be ridden in more difficillt terrain, over larger obstacles and larger jumps, (2) the longest in suspension travel and use components that fit heavy duty in-tended use. While all that is true, there is no guarantee that extreme riding will not break a Freeride bike. The terrain and type of riding that Freeride bikes are designed for is inherently dan-gerous. Appropriate equipment, such as a Freeride bike, does not change this reality. In this kind of riding, bad judgment, bad luck, or riding beyond your capabiilties can easily result in an accident, where you could be seriously injured, paralyzed or killed.
- NOT INTENDED: To be an excuse to try anything. Read Section 2. F, p..11.
- TRADE OFF: Freeride bikes are more rug-ged than All-Mountain bikes, for riding ere ifficult terrin Freeride bikes are heavier and harder to ride uphill than All-Mountain bikes.

CONDITION 5: Bikes designed for jumping, hucking, high speeds, or aggressive riding on rougher surfaces, or landing on flat surfaces. How-ever, this type of riding is extremely haz-ardous and puts unpredictable forces on a bicycle which may overload the frame, fork, or parts. If you choose to ride in Condition 5 terrain, you should take appropriate safe-ty precautions such as more frequent bike inspections and replacement of equipment. You should also ve safe-ty equipment such as a full-face helmet, pads, and body armor.

- INTENDED: For man-made dirt jumps, ramps, skate parks other predictable obstacles and ter-rain where riders need and use skill and bike control, rather than suspension. Dirt Jumping bikes are used much like heavy duty BMX bikes.
- A Dirt Jumping bike does not give you skills to jump. Read Section 2.F, p.r.1.
- NOTINTENDED:Forterrain,dropofffsorlandingswherelargeamountsofsuspension travel are needed to help absorb the shock of landing and help maintain control.
- TRADE OFF: Dirt Jumping bikes are lighter and more nimble than Freeride bikes, but they have no rear suspension and the suspension travel in the front is much shorter.

## CYCLO-CROSS

CONITION 2: Bikes designed for riding Condition 1, plus mooth gravel roads and improved tralls with modera grades where the tires do not lose ground contact.

- INTENDED: For cyclocross riding, training and racing. Cyclo-cross involves riding on a variety of terrain and surfaces including dirt or mud surfaces. Cyc
 lo-cross bikes also work well for all weather rough road riding and com-muting.
- NOT INTENDED: For off road or mountain bike use, or jump-ing. Cyc $l$-cross riders and racers dismount before reaching an obstacle, carry their bike over the obstacle and then remount. Cyclo-cross bikes are not intended for mountain bike use. The relatively large road bike size wheels are fas er than the smaller mountain nike wheels, but not as strong.

## APPENDIX C

THE LIFESPAN OF YOUR BIKE AND ITS COMPONENTS

1. Nothing Lasts Forever, Including Your Bike.

When the useful life of your bike or its components is over, continued use is hazardous. Every bicycle and its component parts have a finite, limited useful life. The length of that life will vary with the construction and materials used in the frame and compon ts; the maintenance and care the frame and components receive over the life; and the type and amount of use to which the frame and components are subjec-
ted. Use in competitive events, trick riding, ramp riding, jumping, aggressive riding, riding on severe terrain, riding in severe climates, riding with heary loads, commercial activities and other types of non-standard use can dramatically shorten the life of the frame and components. Any one or a combination of these conditions may result in an unpredictable failure. Al aspects of use being identical, lightweight bicycles and their components wiil usually have a shorter ifie than heavier bicycles and their components. In selecting a lightweight bicycle or components you are making a tradeoff, favoring the higher performance that comes with lighter weight over longevity. $S$, If you choose lightweight, high performance equipment, be sure to have it inspected frequently. You should have your bicycle and its components checked periodically by a bicycle dealer for indicators of stress and/or potential failure, including cracks, deformation, corrosion, paint peeling, dents, and any other indicators of potential problems, inappropriate use or abuse. These are important safety checks and very important to help prevent accidents, bodily injury to the rider and shortened product life.

## 2. Perspective

Today's high-performance bicycles require frequent and careful inspection and service. In this Appendix, we try to explain some underlying material science basics and how they relate to your bicycle. We discuss some of the trade-offs made in designing your bicycle and what you can expect from your bicycle; and we provide important,

 attention.
\$ WARNNG: Like any mechanical device, a bicycle and its components are subject to wear and stress. Different materials and mechanisms wear or fatigue
from stress at different rates and have different life cycles. If a component's life cycle is exceeded, the component can suddenly and catastrophically fail, causing serious injury or death to the rider. Scratches, cracks, fraying and discoloration are signs of stress-caused fatigue and indicate that a part is at the end of its useful life and needs to be replaced. While the materials and workmanship of your bicycle or of individual components may be covered by a warranty for a speciried period of time by the manufacturer, this is no guarantee that the product will last the term of the warranty. Product life is often related to the kind of riding you do and to the treatment to which you submit the bicycle. The bicycle's warranty is not meant to suggest that the bicycle cannot be broken or will last forever. It only means that the bicycle is covered subject to the terms of the warranty. Please be sure to read Appendix $B$, Intended Use of your bicycle and Appendix $C$, the lifespan of your bike and its components.

## A. UNDERSTANDING METALS

Steel is the traditional material for building bicycle frames. It has good characteristics, ut in high performance bicycles, steel has been largely replaced by aluminum and some fanium. bicycles

## Properties of Metals:

Please understand that there is no simple statement that can be made that charactefizes the use of different metals for hicycles. What is true is how the metal chosen is pplied is much more important than the material alone. One must look at the way the ike is desined tested mantectured supported anon with the characteristics of the
metal rather than seeking a simpisitic answer. Metals vary widely in their resistance to corrosion. Steel must be protected or rust will attack it. Aluminum and Titanium quick develop an oxide film that protects the metal from further corrosion. Both are therefore quite resistant to corrosion. Aluminum is not perfectly corrosion resistant, and particular care must be used where it contacts other metals and gavanic corrosion can occur. Metals are comparatively ductile. Ductile means bending, buckling and stretching before breaking. Generally speaking, of the common bicycle frame building materials steel is the most ductile, titanium less ductile, followed by aluminum. Metals vary in density. Density is weight per unit of material. Steel weighs 7.8 grams $/ \mathrm{cm} 3$ (grams per cubic centimeter), titanium 4.5 grams $/ \mathrm{cm} 3$, aluminum 2.75 grams $/ \mathrm{m} 3$. Contrast these num bers with carbon fiber composite a 1.45 grams $/ \mathrm{m} 3$. Metals are subject to fatigue. With enough cycles of use, at high enough loads, metals will eventually develop cracks tha lead to failure. It is very important that you read the basics of metal fatigue below. Let's say you hita a curb, ditch, rock, car, another cyclist or other object. At any speed above a fast walk, your body will continue to move forward, momentum carrying you over the front of the bike. You cannot and will not stay on the bike, and what happens to the frame, fork and other components is isrelevant to what happens to your body. What should you expect from your metal frame? It depends on many complex factors, which is blw Alumu is less ductile than steol but you cen expect the fork ad fram to be bed lumincled Hit harder and the top tue may be roken in tension and the down twe buckled Hit harder and the too tube may be broken the down tube buckled and broke leaving the head tube and fork separated from the main triangle When a metal bike leaving the head tube and fork separated from the main triangle. When a metal bike meta $H$ is now con for and
fiber. See Secion B, Understanding composites below. The relaive ductirity of metal and the lack of ductility of carbon fiber means that in a crash scenario you can expe some bending or bucking in the metal but none in the carbon. Below some load the car bon fork may be intact even though the frame is damaged. Above some load the carbon fork will be completely broken.

## The basics of metal fatigue

Common sense tells us that nothing that is used lasts forever. The more you use somet hing, and the harder you use it, and the worse the conditions you use it in, the shorter its life. Fatigue is the term used to describe accumulated damage to a part caused by repeated loading. To cause fatigue damage, the load the part receives must be great enough. A crude, often-used example is bending a paper clip back and forth (repeated looding) until it breaks. This simple definition will help you understand that fatigue ha nothing to do with time or age. A bicycle in a garage does not fatigue. Fatigue happer only through use. So what kind of "damage" are we talking about? On a microscopic level, a crack forms in a highly stressed area. As the load is repeatedly applied, the crack grows. At some point the crack becomes visible to the naked eye. Eventually it becomes so large that the part is too weak to carry the load that it could carry without the crack a mar por is so strong that pige if is nearly infinite This repures olot con desterid and a lot of weight Any structure that must be light and strong will have a finite fatio life Aircraft race cars, motorcycles all have parts with finite fatioue lives If you watt a icycle with infinite fatigulfit it would weigh for the
 we inspect the structure.

What to look for:

- ONCE A CRACKS STARTS IT CAN GROW AND GROW FAST. Think about the crack as forming a pathway to failure. This means that any crack is potentially dangerous and will only become more dangerous.

## IMPLE RULE $1: 1$ li you find crack, replace the part

- CORROSION SPEEDS DAMAGE. Cracks grow more quickly when they are in a corrosive environment. Think about the corrosive solution as further weakening and extending the crack.

## IMPLE RULE 2: Clean your bike, lubricate your bike, protect your bike from salt, re-

 move any salt as soon as you can.- STAINS AND DISCOLORATION CAN OCCUR NEAR A CRACK. Such staining may be a warning sign that a crack exists.

MPLE RUE 3 : Insect and investigate any staing to see if it is assciated with a crack.

- SIGNFICANT SCRATCHES, GOUG-ES, DENTS OR SCORING CREATE STARTING POINTS FORCRACKS. Think about the cut surface as a focal point for stress (in fact engineers alsucheres" seen glass cut? Recall how the glass was scored and then broke on the scored line.

SIMPLE RULE 4: Do not scratch, gouge or score any surface. If you do, pay frequent attention to this area or replace the part

- SOME CRACKS (particularly larger ones) MAY MAKE CREAKING NOISE AS YOU RIDE. Think about such a noise as a serious warning signal. Note that a well-maintaned bicycle will be very quiet and free of creaks and squeaks.

## SMPLE RULE 5: Investigate and find the source of any noise. It may not a be a crack,

 ut whatever is causing the noise should be fixed promptly.
## Fatigue is not a perfectly predictable science

Fatigue is not a perfectly predictable science, but here are some general factors to help you to determine how often your bicycle should be inspected. The more you fit the "shoren product life" profile, the more frequent your need to inspect. The more you fit the engthen product life" profile, the less frequent your need to inspect.

## Factors that shorten product life

Hard, harsh riding style
"Hits", crashes, jumps, other "shots" to the bike
High mileage
Higher body weight
Stronger, more fit, more aggressive rider
st ir winter road salt, accumulated sweat)
Presence of arrasive mud, dirt, sand, soil in riding environment

Factors that lengthen product life

- Smooth, fluid riding style

No "hits", crashes, jumps, other "shots" to the bike
Low mileage
Lower body weight

- Less aggressive rider

Non-corrosive environment (dry, salt-free air)
Clean riding environment
\$. WARNING: Do not ride a bicycle or component with any crack, bulge or den even a small one. Riding a cracked frame, fork or component could lead to complet ailure, with risk of serious injury or death

## B UNDEPSTANDING COMPOSITES

All riders must understand a fundamental reality of composites. Composite materials netur d carbon fibers are strong and light but when crashed or overloaded, ar bon fibers do not bend, they break.

## What are composites?

The term "composites" refers to the fact that a part or parts are made up of different components or materials. You've heard the term "carbon fibere bike." This really means "composite bike." Carbon fiber composites are typically a strong, light fiber in a matrix of plastic, molded to form a shape. Carbon composites are light relative to metals.

Steel weighs 7.8 grams/cm3 (grams per cubic centimeter, titanium 4.5 grams $/ \mathrm{cm} 3$ aluminum 2.75 grams $/ \mathrm{cm} 3$. Contrast these numbers with carbon fiber composite at 1.45 grams $/ \mathrm{cm} 3$. The composites with the best strength-to-weight ratios are made of carbo fiber in a matrix of epoxy plastic. The epoxy matrix bonds the carbon fibers togethe, transfers load to other fibers, and provides a smooth outer surface. The carbon fibers are the "skeleton" that carries the load.

## Why are composites used?

Unlike metals, which have uniform properties in all directions (engineers call this isotropic), carbon fibers can be placed in specific orientations to optimize the structure for particular loads. The choice of where to place the carbon fibers gives engineers a powerful tool to create strong, light bicycles. Engineers may also orient fibers to suit other goals such as comfort and vibration damping. Carbon fiber composites are very corrosion resistant, much more so than most metals. Think about carbon fibe or fiberg lass boats. Carbon fiber materials have a very high strength-to-weight ratio.

## What are the limits of composites?

Well designed "composite" or carbon fiber bicycles and components have long fatigue ves, usually better than their metal equivalents. While fatigue life is an advantage of ca bon fiber, you must still regularly inspect your carbon fiber frame, fork, or components Carbon fiber composites are not ductile. Once a carbon structure is overloaded, it w not bend; it will break. At and near the break, there will be rough, sharp edges and maybe delamination of carbon fiber or carbon fiber fabric layers. There will be no bending. buckling, or stretching.
bike?

Lets say you hit a curb, ditch, rock, car, other cyclist or other object. At any speed above fast walk, your body will continue to move forward, the momentum carrying you over he front of the bike. You cannot and will not stay on the bike and what happens to the rame, fork and other components is irrelevant to what happens to your body. What fhould you expect from your carbon frame? It depends on many complex factors. But we can tell you that if the impact is hard enough, the fork or frame may be completely broken. Note the significicant difference in behavior between carbon and meta. See Secion 2. A, Understanding metals in this Appendix. Even if the carbon frame was twice as strong as a metal frame, once the carbon frame is overloaded it will not bend, it will break completely.
WARNING: Be aware that high temperature in a confined environment can affect the integrity of composite materials, resulting in component failure which could cause yout to lose control and fall.

## INSPECTION OF COMPOSTIE FRAME, FORK, AND COMPONENTS:

## CRACKS

spect for cracks, broken, or splintered areas. Any crack is serious. Do not ride any bicycle or component that has a crack of any size.

## elamination

Delamination is serious damage. Composites are made from layers of fabric. Delami-
nation means that the layers of fabric are no longer bonded together. Do not ride any bicycle or component that has any delamination. These are some delamination clues:

1. A cloudy or white area. This kind of area looks different from the ordinary undamaged areas. Undamaged areas will look glassy, shiny, or "deep," as if one was looking into a clear liquid. Delaminated areas will look opaque and cloudy.
2. Bulging or deformed shape. If delamination occurs, the surface shape may change. The surface may have a bump, abulge, soft spot, or not be smooth and fair.
3. A difference in sound when tapping the surface. If you gently tap the surface of an undamaged composite you will hear a consistent sound, usually a hard, sharp sound. If you then tap a delaminated area, you will hear a different sound, usually duller, less sharp.

## Unusual Noises:

Either a crack or delamination can cause creaking noises while riding. Think about such noise as a serious warning signal. A well maintained bicycle will be very quiet and free creaks and squeaks. Inestige

## . WARNING: Do not ride a bicycle or component with any delamination or

 Pid a d crack. Riding a delaminated or cracked frame, fork orto complete failure, with risk of serious injury or death.

## C. UNDERSTANDING COMPONENTS

It is often necessary to remove and disassemble components in order to properly and carefully inspect them. This is ajob for a professional bicycle mechanic with the specia tools, skills and experience to inspect and service today's high-tech high-performance bicycles and their components.

## Aftermarket "Super Light" components

Think carefully about your rider profile as outtined above. The more you at the "shorten product life" profile, the more you must question the use of super light components. The more you at the "lengthen product life" profile, the more likely it is that lighter components may be suitable for you. Discuss your needs and your profile very honestly with PROPAIN. Take these choices seriously and understand that you are responsible for the changes. A useful slogan to discuss with PROPAIN if you contemplate changing compo nents is "Strong, Light, Cheap -pick two."

## Original Equipment components

Bicycle and component manufacturers tests the fatique life of the components that ar original equipment on your bike. This means that they have met test criteria and have reasonable fatigue life. It does not mean that the original components will last forever. They won't.

## APPENDIX D COASTER BRAKE

The coaster brake is a sealed mechanism which is a part of the bicycle's rear wheel hub. The brake is activated by reversing the rotation of the pedal cranks (see fig. 5). Star with the pedal cranks in a nearly horizontal position, with the front pedal in about the $40^{\circ}$ 'llock position, and apply downward foot pressure on the pedal that is to the rear About $1 / 8$ turn rotation will activate the brake. The more downward pressure you apply, the more braking force, up to the point where the rear wheel stops rotating and begins to skid.
WARNNG: Before riding, make sure that the brake is working properly. If it is not working properly, have the bicycle checked by a bicycle dealer beforre you ride it
\$ WARNNG: If your bike has only a coaster brake, ride conservatively. A single rear brake does not have the stopping power of front-and-rear brake systems.
2. Adjusting your coaster brake

Coaster brake service and adjustment requires special tools and special knowledge. Do not attempt to disassemble or service your coaster brake. Take the bicycle to a bicycle dealer for coaster brake service.

## APPENDIX E

AASTENER TOROUE SPECIFICATION
Correct tightening torque of threaded fasteners is very important to your safety. Always ghten fasteners to ine corect torque. In case of a confict between in this manual and information provided by a ROPAIN customer service representaive for clarfication. Bolts that are too tight can sretch and deform. Bolts that are too loose can move and fatigue. Either mistake can lead to a sudden failure of the bolt. Always use a correctly calibrated torque wrench to ghten critical fasteners on your bike. Carefully follow the torque wrench manufacturer's histructions on the correct way to set and use the torque wrench for accurate results. Critical fasteners are for example: Fasteners for wheels, handlebars, stem, cranks, p dals, frame suspension components (see front and back cover of this manual for spe cific tightening torque specifications for your PROPAIN model), seat clamp, and saddle.

## Cable routing guide

2 a

Routing brake and derailleur cables through the frame
The cables for the brake and derailleur can be routed upwards through the downtube starting a the outtets near the bottom bracket. The cables need to be fixed at the outter with a cable tie or bolt. To avoid noise during your ride a foam tube can be added around the cables.
Before routing the cable remove all rubber grommets from the cable inlets and insert them again when you are finished.
A professional tool which helps the cable routing is offered by Parktool or similar bicycle tool manufacturers.
WARNNG: The above described cable routing should only be carried out by a professional bicycle mechanic. Riding your bike with improperly installed brakes an lead to crashes and therefore iniwies or death.
